The Italian language original "Terzo pilastro di Basilea 3 – Informativa al pubblico al 31 dicembre 2015" was approved by the Management Board of Intesa Sanpaolo on 15 March 2016 and is available on group.intesasanpaolo.com

This document contains certain forward-looking statements, projections, objectives, estimates and forecasts reflecting the Intesa Sanpaolo management's current views with respect to certain future events. Forward-looking statements, projections, objectives, estimates and forecasts are generally identifiable by the use of the words "may," "will," "should," "plan," "expect," "anticipate," "estimate," "believe," "intend," "project," "goal" or "target" or the negative of these words or other variations on these words or comparable terminology. These forward-looking statements include, but are not limited to, all statements other than statements of historical facts, including, without limitation, those regarding Intesa Sanpaolo's future financial position and results of operations, strategy, plans, objectives, goals and targets and future developments in the markets where Intesa Sanpaolo participates or is seeking to participate.

Due to such uncertainties and risks, readers are cautioned not to place undue reliance on such forward-looking statements as a prediction of actual results. The Intesa Sanpaolo Group's ability to achieve its projected objectives or results is dependent on many factors which are outside management's control. Actual results may differ materially from (and be more negative than) those projected or implied in the forward-looking statements. Such forward-looking information involves risks and uncertainties that could significantly affect expected results and is based on certain key assumptions.

All forward-looking statements included herein are based on information available to Intesa Sanpaolo as of the date hereof. Intesa Sanpaolo undertakes no obligation to update publicly or revise any forward-looking statement, whether as a result of new information, future events or otherwise, except as may be required by applicable law. All subsequent written and oral forward-looking statements attributable to Intesa Sanpaolo or persons acting on its behalf are expressly qualified in their entirety by these cautionary statements.

Introduction

Notes to the Basel 3 Pillar 3 disclosure

With effect from 1 January 2014, the reforms of the accord by the Basel Committee ("Basel 3") were implemented in the EU legal framework. Their aim is to improve the banking sector's ability to absorb shocks arising from financial and economic stress, whatever the source, improve risk management and governance, and strengthen banks' transparency and disclosures. In doing so, the Committee maintained the approach based on three Pillars, which was at the basis of the previous capital accord, known as "Basel 2", supplementing and strengthening it to increase the quantity and quality of intermediaries' available capital as well as introducing counter-cyclical regulatory instruments, provisions on liquidity risk management and financial leverage containment.

In particular, Pillar 3 – which concerns public disclosure obligations on capital adequacy, risk exposure and the general characteristics of related management and control systems, with the aim of better regulating the market – was also reviewed. Amongst other things, the amendments were designed to introduce greater transparency requirements, more information on the composition of regulatory capital and the methods used by banks to calculate capital ratios.

That said, the content of "Basel 3" was incorporated into two EU legislative acts:

- Regulation (EU) No. 575/2013 of 26 June 2013 (CRR), which governs the prudential supervision requirements of Pillar 1 and public disclosure requirements (Pillar 3);
- Directive 2013/36/EU of 26 June 2013 (CRD IV), which, among other things, deals with the access to the activity of credit institutions, freedom of establishment, freedom to provide services, supervisory review process, and additional equity reserves.

EU legislation is complemented by the provisions issued by the Bank of Italy with Circular no. 285 of 17 December 2013, which contains the prudential supervision regulations applicable to Italian banks and banking groups, reviewed and updated to adjust the internal regulations to the new elements of the international regulatory framework, with special reference to the new regulatory and institutional structure of banking supervision of the European Union and taking into account the needs detected while supervising banks and other intermediaries.

The above Circular does not dictate - as it did in the past - specific rules for the preparation and disclosure of Pillar 3 reporting, but simply reports the list of provisions envisaged for that purpose by the CRR. Therefore, the issue is directly regulated by:

- the CRR, Part 8 "Disclosure by Institutions" (art. 431-455) and Part 10, Title I, Chapter 3, "Transitional provisions for disclosure of own funds" (Art. 492);
- the Regulations of the European Commission whose preparation is entrusted to the EBA (European Banking Authority) bearing the regulatory or implementing technical standards to regulate the uniform templates for the disclosure of various types of information.

Further information was provided by the EBA (European Banking Authority) with a specific document on the issues of materiality, confidentiality and frequency of disclosure to be provided in Pillar 3 (Guidelines on materiality, proprietary and confidentiality and on disclosures frequency under Articles 432(1), 432(2) and 433 of Regulation (EU) No. 575/2013).

The issue of Pillar 3 disclosure was also the subject of analyses by the Basel Committee with its document "Revised Pillar 3 disclosure requirements" which proposed for the future the introduction of international standard schemes.

In accordance with the abovementioned provisions, this document has been drawn up on a consolidated basis with reference to a "prudential" scope of consolidation, essentially corresponding to the definition of Banking Group for Regulatory purposes (integrated by the proportional consolidation of jointly controlled entities).

Under the terms of art. 433 of the CRR, banks publish the disclosures envisaged in European regulations at least once a year, at the same time as the financial statements. They are also required to assess the need to publish some or all these disclosures more frequently, based on the significant characteristics of current activities. In particular, entities must assess whether there is a need to publish disclosures more

frequently in relation to "Own Funds" (art. 437), "Capital Requirements" (art. 438), and disclosures regarding risk exposure or other aspects subject to rapid change. Furthermore, in accordance with Article 16 of Regulation (EU) No. 1093/2010, the EBA (European Banking Authority) has issued guidance on the entities' assessment of the need to publish disclosures more frequently (Guidelines on materiality, proprietary and confidentiality and on disclosure frequency).

Given the above regulatory provisions, when issuing its interim reports for March and September, Intesa Sanpaolo publishes summary disclosures on its "Own Funds", "Capital Requirements" and "Leverage" (the latter from 2015 as specifically provided for by applicable regulations), included in the half-yearly report with additional information on the use of internal models.

Additional information concerning the various types of risk to which the Intesa Sanpaolo Group is exposed is presented in the consolidated financial statements based on the provisions of IFRS 7 and the related explanatory instructions issued by the Bank of Italy (Circular 262 and related updates). The information on Group risks is set forth in Part E of the Notes to the consolidated financial statements. Part E illustrates:

- the various types of risks of the insurance segment (Part E Information on risks and relative hedging policies: Section 2 – Risks of insurance companies);
- the risks of other companies (Part E Information on risks and relative hedging policies: Section 3 risks of other companies);
- Banking Group liquidity risk (Part E Information on risks and relative hedging policies: Section 1 Risks of the Banking Group: 1.3 Liquidity risk);
- Banking Group foreign exchange risk (Part E Information on risks and relative hedging policies:
 Section 1 Risks of the Banking Group: 1.2.3 Foreign exchange risk)
- exposure to structured credit products (Part E Information on risks and relative hedging policies:
 Section 1 Risks of the Banking Group: Information on Structured credit products);
- legal and tax disputes (Part E Information on risks and relative hedging policies: Section 1 Risks of the Banking Group: 1.4 Operational risk - Legal risks and tax litigation).

In order to better understand the organisation of the Group and the consequent capital absorption by Business Unit and the relevant distribution of the "Risk-weighted assets", reference is made to the Report on operations of the consolidated financial statements (Breakdown of consolidated results by business area and geographical area – Balance sheet aggregates).

The "Corporate Governance Report and Information on Ownership Structures - Report on Remuneration" includes all the information concerning the Corporate Governance system of Intesa Sanpaolo and the remuneration policies in force. The "Report" is available for consultation from the "Governance" section of the Bank's website at: www.group.intesasanpaolo.com.

In particular, the Report on Corporate Governance includes the information required by paragraph 2 of art. 435 of the CRR:

- the number of administrative tasks assigned to the members of the management body;
- the engagement policy for the selection of members of the management body and their actual knowledge, skills, and experience;
- the diversity policy adopted in the selection of members of the management body, its objectives and any targets set within the framework of that policy as well as the extent to which these objectives and targets have been achieved;
- whether the entity has set up a separate risk committee and the number of times that the latter met;
- the description of the flow of information on risks to the management body.

The Report on Remuneration includes all the information required by art. 450 of the CRR on the remuneration policy and procedures for those categories of staff whose professional activities have a material impact on the risk profile of the Bank.

The Group's website also contains the information on the value of the indicators of global systemic importance (Governance \ risk management Section of the website: "Indicators of the assessment methodology to identify the global systemically important banks").

Given the public importance of this disclosure, the "Basel 3 Pillar 3 disclosure" is signed by the Manager responsible for preparing the Company's financial reports and is subject to the checks and controls established in the Group's "Guidelines for administrative and financial governance", which set out the rules for the application of art. 154 bis of the Consolidated Law on Finance in the Intesa Sanpaolo Group. In particular, the internal control system for accounting and financial information is designed to ensure the ongoing verification of the adequacy and effective implementation of the administrative and accounting procedures at Group level.

Given the importance to investors of the "Basel 3 Pillar 3" disclosure, Intesa Sanpaolo has decided that this Document should be the subject of a limited review by the Independent Auditors KPMG S.p.A. The related audit report is published together with this document.

All the amounts reported in this disclosure, unless otherwise specified, are stated in millions of euro. Since public disclosure regulations for "Leverage" entered into force on 1 January 2015, the comparative figures as at 31 December 2014 have not been provided for this area.

Lastly, an explanation of the meaning of certain terms and/or abbreviations commonly used in this disclosure is provided in the specific glossary annexed to this document.

The Intesa Sanpaolo Group publishes this disclosure (Basel 3 Pillar 3) and subsequent updates on its website, www.group.intesasanpaolo.com.

Own Funds and capital ratios as at 31 December 2015

	(1	millions of euro)
Own funds and capital ratios	31.12.2015	31.12.2014
Own funds		
Common Equity Tier 1 capital (CET1) net of regulatory adjustments	36,908	36,547
Additional Tier 1 capital (AT1) net of regulatory adjustments	2,302	1,700
TIER 1 CAPITAL	39,210	38,247
Tier 2 capital net of regulatory adjustments	8,089	8,043
TOTAL OWN FUNDS	47,299	46,290
Risk-weighted assets		
Credit and counterparty risks	245,793	231,394
Market and settlement risk	16,582	16,476
Operational risks	20,653	21,157
Other specific risks ^(a)	1,291	763
RISK-WEIGHTED ASSETS	284,319	269,790
% Capital ratios		
Common Equity Tier 1 capital ratio	13.0%	13.5%
Tier 1 capital ratio	13.8%	14.2%
Total capital ratio	16.6%	17.2%

⁽a) The caption includes all other elements not contemplated in the foregoing captions that are considered when calculating total capital requirements.

Own Funds, risk-weighted assets and the capital ratios as at 31 December 2015 were calculated according to the harmonised rules and regulations for banks and investment companies contained in Directive 2013/36/EU (CRD IV) and in (EU) Regulation 575/2013 (CRR) of 26 June 2013, which transpose the banking supervision standards defined by the Basel Committee (the Basel 3 Framework) to European Union laws, and on the basis of Bank of Italy Circulars.

Regulatory provisions governing Own Funds envisage the gradual introduction of the new regulatory framework, through a transitional period generally lasting until 2017, during which several elements that will be eligible for full inclusion in or deduction from Common Equity when the framework is fully effective, will only have a partial percentage effect on Common Equity Tier 1 capital. Generally, the residual percentage, after the applicable portion, is included in/deducted from Additional Tier 1 Capital (AT1) or Tier 2 Capital (T2), or is considered among risk-weighted assets.

Specific transitional provisions have also been established for subordinated instruments that do not meet the requirements envisaged in the new regulatory provisions, aimed at the gradual exclusion of instruments no longer regarded as eligible from Own Funds (over a period of eight years).

Accordingly, the prudential ratios as at 31 December 2015 take account of the adjustments envisaged by the transitional provisions for 2015.

As at 31 December 2015, total Own Funds came to 47,299 million euro, against risk-weighted assets of 284,319 million euro, resulting primarily from credit and counterparty risk and, to a lesser extent, operational and market risk. The increase in risk-weighted assets related to credit risk compared to 31 December 2014 may be attributed, in part, to the impact of the European Commission Decision, which, when published in the specific list, specified the nations for which a regime equivalent to the one prevailing in the European Union for the weighting of exposure to central banks and government bodies is applicable as of 1 January 2015, thereby eliminating the possibility to apply the previously preferential weighting indistinctly for each foreign nation.

With regard to Additional Tier 1 (AT1), it should be recalled that in September 2015 Intesa Sanpaolo issued an Additional Tier 1 capital instrument in the amount of 1 billion dollars. The Additional Tier 1 instrument presents characteristics in line with CRD IV, is perpetual and may be redeemed in advance by the issuer after ten years from the issue date and on each coupon payment date thereafter. The coupon, payable semi-annually in arrears on 17 March and 17 September of each year, is equal to 7.7% per annum. If the early redemption option is not exercised on 17 September 2025, a new fixed-rate coupon will be determined for the following five years (until the next recalculation date). As envisaged in the regulations applicable to Additional Tier 1, coupon payment is discretionary and subject to certain limitations.

The total capital ratio stood at 16.6%, while the ratio of the Group's Tier 1 Capital to its total risk-weighted assets (Tier 1 ratio) was 13.8%. The ratio of Common Equity Tier 1 Capital (CET1) to risk-weighted assets (the Common Equity ratio) was 13.0%.

The ECB's final decision concerning the capital requirements to be observed with effect from 1 January 2016, in light of the results of the Supervisory Review and Evaluation Process (SREP), imposed a consolidated capital requirement on Intesa Sanpaolo of 9.5% in terms of the CET1 ratio. The minimum CET1 ratio set by the ECB for 2015 was 9%.

It bears emphasising that Common Equity Tier 1 capital included, as a positive component, the net income for the year ended 31 December 2015, since the conditions for its inclusion were met in accordance with Art. 26(2) of the CRR, and, as a negative component, the related dividend that the Management Board will propose to the Shareholders' Meeting for distribution on the net income for 2015, i.e. 14 cents per each ordinary share and 15.1 cents per each savings share, for a total dividend of 2,361 million euro. Finally, on the basis of Article 467 (2) of the CRR, adopted by the Bank of Italy in Circular 285, the Intesa

Sanpaolo Group has opted to exclude unrealised gains or losses on exposures to central administrations classified among financial assets available for sale (AFS) from its Own Funds. The effect on Common Equity Tier 1 Capital as at 31 December 2015 was 1 basis point negative.

Section 1 – General requirements

Qualitative disclosure

Introduction

The Intesa Sanpaolo Group attaches great importance to risk management and control to ensure reliable and sustainable value creation in a context of controlled risk.

The risk management strategy aims to achieve a complete and consistent overview of risks, given both the macroeconomic scenario and the Group's risk profile, by fostering a culture of risk-awareness and enhancing the transparent and accurate representation of the risk level of the Group's portfolios.

Risk-acceptance strategies are summarised in the Group's Risk Appetite Framework (RAF), approved by the Management Board and Supervisory Board. The RAF, introduced in 2011 to ensure that risk-acceptance activities remain in line with shareholders' expectations, is established by taking account of the Intesa Sanpaolo Group's risk position and the economic situation.

The general principles that govern the Group's risk-acceptance strategy may be summarised as follows:

- The Intesa Sanpaolo Banking Group is focused on a commercial business model in which domestic retail activity remains the Group's structural strength;
- the Group does not aim to eliminate risks, but rather attempts to understand and manage them so as
 to ensure an adequate return for the risks taken, while guaranteeing the Company's solidity and
 business continuity in the long term;
- Intesa Sanpaolo has a moderate risk profile in which capital adequacy, earnings stability, a sound liquidity position and a strong reputation are the key factors to protecting its current and prospective profitability;
- Intesa Sanpaolo aims at a capitalisation level in line with its main European peers;
- Intesa Sanpaolo intends to maintain strong management of the main specific risks (not necessarily associated with macroeconomic shocks) to which the Group may be exposed;
- the Group attaches great importance to compliance and reputational risks: for compliance risk, the Group aims for formal and substantive compliance with rules in order to avoid penalties and maintain a solid relationship of trust with all of its stakeholders. For reputational risk, the Intesa Sanpaolo Group strives to actively manage its image in the eyes of all stakeholders and aims to prevent and contain any negative effects on said image.

The Risk Appetite Framework thus represents the overall framework in which the risks assumed by the Group are managed, with the establishment of general principles of risk appetite and the resulting structuring of the management of:

- the overall risk profile; and
- the Group's main specific risks.

Management of the overall risk profile is based on the general principles laid down in the form of a framework of limits aimed at ensuring that the Group complies with minimum solvency, liquidity and profitability levels even under the conditions of severe stress. In addition, it aims to ensure the desired reputational and compliance risk profiles.

In detail, management of overall risk is aimed at maintaining adequate levels of:

- capitalisation, even under conditions of severe macroeconomic stress, with respect to both Pillar 1 and Pillar 2. In further detail, capital adequacy is assessed by monitoring:
 - o Common Equity and the Total Capital Ratio, for Pillar 1;
 - the Leverage Ratio and Risk-Bearing Capacity, for Pillar 2;
- liquidity, so as to respond to periods of tension, including extended periods of tension, on the various funding sourcing markets, with regard to both the short-term and structural situations; the Liquidity Coverage Ratio, the Net Stable Funding Ratio and the Funding/Lending Gap;
- earnings stability, so as to ensure profitability even in stress scenarios through an adequate mix of business:
- management of operational, compliance and reputational risk so as to minimise the risk of negative events that jeopardise the Group's economic stability and image.

In compliance with the EBA guidelines (EBA/GL/2015/02) concerning the "Minimum list of quantitative and qualitative recovery plan indicators", the Group has included new indicators in its 2015 Recovery Plan

(mainly asset quality indicators, market-based indicators and macroeconomic indicators) and has agreed with the regulator to also include them in the RAF as early warning thresholds on updating the framework for 2016

Management of the main specific risks is aimed at determining the risk appetite that the Group intends to assume with regard to exposures that may represent especially significant concentrations. Such management is implemented by establishing ad hoc limits, management processes and mitigation measures to be taken in order to limit the impact of especially severe scenarios on the Group. Such risks are assessed on the basis of stress scenarios, are subject to periodic monitoring within the framework of Risk Management systems and constitute early warning indicators, especially as regards capital adequacy. In detail, the main specific risks monitored are:

- especially significant risk concentrations (e.g., concentration on individual counterparties, sovereign risk or commercial real estate);
- the individual risks that make up the Group's overall risk profile and whose operating limits, as envisaged in specific policies, complete the Risk Appetite Framework.

In light of the Italian macroeconomic context and its extreme uncertainty, in 2015 credit risk was identified as a priority area for analysis, also considering its significant amount for the Group. At the time of the annual update of the RAF, in line with the European peer competitors' standards, it was decided to develop a specific credit risk framework to identify suitable limits both for governing credit risk from the centre (by standardising and codifying the approach and use of analytical instruments) and identifying areas for growth in commitments with equivalent/lower risk for the Bank and areas to be kept under control.

In compliance with the recent instructions from the Bank of Italy, the Group Risk Appetite is organised (both in terms of the total risk and in terms of the main specific risks) on the subsidiaries that contribute significantly to risks and/or specific local characteristics: Banca IMI, Banca Fideuram, Intesa Sanpaolo Vita, Fideuram Vita and the international subsidiaries. Overall risk management is implemented by monitoring key aspects (capital adequacy, liquidity and reputation) according to an approach similar to that followed at the Group level.

Defining the Risk Appetite Framework is a complex process headed by the Chief Risk Officer, which involves close interaction with the Chief Financial Officer and the Heads of the various Business Units, is developed in line with the ICAAP, ILAAP and Recovery Plan processes, and represents the risk framework in which the Budget and Business Plan are developed. Consistency between the risk-acceptance strategy and policy and the Plan and Budget process is thus guaranteed. In accordance with regulatory constraints and in a manner consistent with the risk profile assumed by the Group, the Chief Financial Officer area lays down the strategic profitability, capital adequacy and liquidity objectives that the Group intends to pursue. These objectives then form the basis for identifying the assets and financial resources to be allocated to the individual business units, including the insurance segment, through a process that involves an assessment of their attractiveness, financial independence, growth potential and ability to create value.

The definition of the Risk Appetite Framework and the resulting operating limits for the main specific risks, the use of risk measurement instruments in loan management processes and controlling operational risk, the use of capital-at-risk measures for management reporting and assessment of capital adequacy within the Group represent fundamental milestones in the operational application of the risk strategy defined by the Supervisory Board and the Management Board along the Group's entire decision-making chain, down to the single operational units and to the single desks.

The Group sets out these general principles in policies, limits and criteria applied to the various risk categories and business areas with specific risk tolerance sub-thresholds, in a comprehensive framework of governance and control limits and procedures.

The assessment of the total Group risk profile is conducted annually with the ICAAP, which represents the capital adequacy self-assessment process according to the Group's internal rules.

Since 2013, the Group has been drawing up a Recovery Plan according to indications from the Supervisory Authorities. The process governing the preparation of that plan is an integral part of the regulatory response agreed with the G20 heads of State to the problem of the cross-border resolution of the "too-big-to-fail" banks and financial institutions, brought to light after the Lehman Brothers' default and the consequences on the financial system at a global level. The Recovery Plan (governed by the Bank Recovery and Resolution Directive, transposed into Italian law by Legislative Decree 180 of 16 November 2015) establishes the methods and measures to be used to take action in the early stage to restore the long-term economic stability of an institution in the event of serious deterioration of its financial situation.

A culture of risk-awareness

The utmost attention is devoted to spreading and sharing a culture of risk-awareness through both periodic updates to the documents prepared (Tableau de Bord, ICAAP and Risk Appetite Framework) and initiatives undertaken with the aim of dealing with specific issues raised from time to time.

In addition, the Group guarantees the spread of a culture of risk-awareness through extensive training efforts aimed at ensuring the proper application of the internal risk management models.

The measures taken in pursuit of this goal are established with a coordinated approach to risk management and are compliant with supervisory regulations, as well as ongoing support from the Parent Company for the local development of risk assessment and monitoring systems within the international subsidiaries.

To that end, in 2015 the CRO Forum was set up, consisting of quarterly meetings of the Chief Risk Officers of the Group's international subsidiary banks with the corresponding structures of the Parent Company. These meetings aim to favour the discussion of common issues and problems, best leverage the specific experiences of all Group structures in charge of risk governance, and improve the understanding of the specific characteristics of all local markets where the Group operates (including regulatory aspects). The CRO Forums are also the most appropriate venue for sharing strategic projects on risk governance conducted at Group level.

The Risk Academy initiative, mainly addressed to the international subsidiaries, is another strategic project that pursues the goal of improving management of Risk Governance at Banking Group level.

The risk management approach aims to achieve increasingly integrated and consistent risk management, considering both the macroeconomic scenario and the Group's risk profile, by fostering a culture of risk-awareness through a transparent, thorough representation of the risk level of portfolios. The efforts made in recent years with the Basel 2 and 3 Project in order to obtain authorisation from the Supervisory Authorities for the use of internal ratings to calculate credit risk requirements and in order to secure validation of internal models for operational and market risks should be seen in this context.

Risk governance organisation

Risk-acceptance policies are defined by the Parent Company's Supervisory Board and Management Board. The Supervisory Board carries out its activity through specific internal committees, among which mention should be made of the Internal Control Committee and the Risk Committee. The Management Board relies on the action of managerial committees, among which mention should be made of the Group Risk Governance Committee. Both corporate bodies receive support from the Chief Risk Officer, who is a member of the Management Board and reports directly to the Chief Executive Officer.

The **Chief Risk Officer**, to whom the Governance Area in charge of the risk management functions as well as the controls on the risk management and internal validation process reports, represents a "second line of defence" in the management of corporate risks that is separate and independent from the business functions.

These functions are performed by the Group Risk Manager, a position established in 2015, who monitors the risk management and control functions, and by the Internal Validation Service.

The Chief Risk Officer is responsible for proposing the Risk Appetite Framework, setting the Group's risk management guidelines and policies in accordance with company strategies and objectives and coordinating and verifying the implementation of those guidelines and policies by the responsible units of the Group, including within the various corporate departments. The Chief Risk Officer ensures management of the Group's overall risk profile by establishing methods and monitoring exposure to the various types of risk and reporting the situation periodically to the corporate bodies. The CRO implements level II monitoring and controls of credit and other risks, and ensures the validation of internal risk measurement systems.

In 2015, the Chief Compliance Officer was established, directly reporting to the Managing Director and CEO, in a position that is independent from operating departments and separate from internal auditing, which ensures the management of Group compliance risk, both in the operating and reputational risk component, including the risk of sanctions, losses or damage arising from improper conduct towards customers or such as to jeopardise the integrity and orderly functioning of the markets (so-called conduct risk). Furthermore, in line with corporate strategies and objectives, the CCO defines guidelines and policies, including statements and limits for the Risk Appetite Framework, and works with the corporate control functions to effectively integrate the risk management process.

The **Group Risk Governance Committee**, chaired by the Managing Director and CEO, is a body with decision-making, consultative and reporting powers. It was established with the aim of ensuring the

monitoring and management of risks and the safeguarding of corporate value at Group level, including internal control systems, in implementation of the strategic guidelines and management policies defined by the corporate bodies. The Committee is also responsible for Basel 2 and 3 project governance and supervising the projects and measures necessary to guarantee compliance.

The Group Financial Risks Committee is a technical body with decision-making and reporting powers, focused both on the banking business (proprietary financial risks for banking and trading books, as well as Active Value Management) and the life insurance business, in the life assurance sector (result exposure to the trend in market variables). The functions of said Committee are set out in two sessions:

- the Risk Analysis and Assessment Session, chaired by the Chief Risk Officer, is responsible for evaluating, in advance of approval by the Corporate Bodies, the methodological and measurement guidelines for financial risks and proposals for operational limits, in addition to defining the distribution thereof amongst the Group's major units; in addition, the session verifies the financial risk profile of the Group and its main operational units;
- the Management Guidelines and Operating Choices Session, chaired by the Chief Financial Officer, provides operational guidelines in implementation of the strategic guidelines and risk management policies laid down by the Corporate Bodies in respect of management of the banking book, liquidity, interest rate and exchange risk and periodically verifies the Group's overall financial risk profile, as well as appropriate measures aimed at mitigating it.

The **Group Control Coordination and Operational Risk Committee** is a technical body that operates with the aim of stepping up coordination and interdepartmental cooperation mechanisms:

- as part of the Group internal control system, facilitating the integration of the risk management process;
- in relation to operational risks, including ICT risk, facilitating its effective management.

The Committee operates within the scope of the guidelines set by the corporate bodies, based on the operational and functional powers delegated by the Management Board of the Parent Company. The Functions of the Group Control Coordination and Operational Risk Committee are organised into specific, separate sessions:

- Integrated Internal Control System Session, for reporting and consulting purposes;
- Operational Risk session, with decision-making, reporting and consulting purposes (in this context, the Committee's duties include periodically reviewing the overall operational risk profile, authorising any corrective measures, coordinating and monitoring the effectiveness of the main mitigation activities and approving operational risk transfer strategies).

The Parent Company is in charge of overall direction, management and control of risks. Group companies that generate credit and/or financial risks are assigned autonomy limits and each has its own control structure. For the main Group subsidiaries, these functions are performed, based on an outsourcing contract, by the Parent Company's risk control functions, which periodically report to the management bodies of the subsidiary.

Within the Chief Risk Officer Governance Area, the **Group Risk Manager** is in charge of the operational implementation of management and strategic guidelines along the decision-making process, down to individual operational units.

The Group Risk Manager performs the following functions:

- It measures and controls the Group's current and future exposure to the various types of risk, particularly market, counterparty, credit, country, interest rate, liquidity, operational and insurance risk, reporting the overall situation to the corporate governance bodies;
- it monitors capital absorption (capital requirements), supporting the Planning and Active Value Management Head Office Department in actively managing capital;
- it proposes the annual update of the RAF to the Chief Risk Officer;
- it proposes to the top management, along with the other competent corporate bodies, the definition
 of the structure of operating limits, including the rights to grant and manage credit, in line with the
 RAF and the allocated capital;
- it oversees regulatory developments and ensures that statutory reports are sent to the Supervisory Bodies with regard to internal models;
- it develops and maintains risk measurement, management and control systems in line with current regulations and international best practices, interacting, for such purposes, with the functions in charge of said corporate processes;
- it adopts capital-at-risk measurements for management reporting and assessment of the Group's Economic Capital adequacy;
- as part of the Tableau de Bord and on a quarterly basis, it reports to the corporate bodies on the situation of the Group's overall risk profile; it compares that situation with the Risk Appetite

- Framework, highlighting any situations that require action by the boards;
- it draws up the annual update of the criteria for identifying significant transactions and provides a prior opinion on such transactions.
- it ensures oversight of level II risk monitoring and controls, as well as contributing to designing level I controls, ensuring verification that they are effectively applied;
- it carries out level II monitoring and controls of credit quality, composition and the evolution of the various loan portfolios and for the purpose of correctly classifying and assessing single names;
- it also monitors and analyses the structure of level II controls for monitoring risks other than credit risk, in order to verify the completeness and continuity of level I controls;
- it identifies any critical issues based on its control/monitoring activities and the results of level I controls, requesting and monitoring the implementation of specific mitigation actions, ensuring prompt reporting to the corporate bodies in the event of breaches or significant shortcomings.

To that end, the Group Risk Manager structure is broken down into the following Departments:

- Credit Risk Management Department;
- Financial and Market Risks Department;
- Enterprise Risk Management Department;
- o Controls Department.

Scope of risks

The risks identified, covered and incorporated within the economic capital are as follows:

- credit and counterparty risk. This category also includes concentration risk, country risk and residual risks, both from securitisations and uncertainty on credit recovery rates;
- market risk (trading book), including position, settlement and concentration risk on the trading book;
- financial risk of the banking book, mostly represented by interest rate and foreign exchange rate risk;
- operational risk, also including legal risk, ICT risk and model risk;
- strategic risk;
- risk on equity investments not subject to line by line consolidation;
- risk on real estate assets owned for whichever purpose;
- insurance risk

Risk hedging, given the nature, frequency and potential impact of the risk, is based on a constant balance between mitigation/hedging action, control procedures/processes and capital protection measures, including in the form of stress tests.

Particular attention is dedicated to managing the short-term and structural liquidity position by following specific policies and procedures to ensure full compliance with the limits set at the Group level and operating sub-areas in accordance with international regulations and the risk appetite approved at the Group level.

The Group also attaches great importance to the management of reputational risk and actively manages its image in the eyes of all stakeholders, aiming to prevent and contain any negative effects on its image, including through robust, sustainable growth capable of creating value for all stakeholders. Reputational risk management is pursued not only through organisational structures with specific duties of reputation monitoring, but also through *ex-ante* risk management processes, defining prevention and mitigation tools and measures in advance and implementing specific, dedicated reporting flows.

Assessments of each single type of risk for the Group are integrated in a summary amount – the economic capital – defined as the maximum "unexpected" loss the Group might incur over a year. This is a key measure for determining the Group's financial structure and its risk tolerance, and guiding operations, ensuring the balance between risks assumed and shareholder return. It is estimated on the basis of the current situation and also as a forecast, based on the Budget assumptions and projected economic scenario under ordinary and stress conditions.

For the purposes described above, the Intesa Sanpaolo Group uses a wide-ranging set of tools and techniques for risk assessment and management, described in detail in this document.

Basel 3 regulations and the Internal Project

As already described in the introduction to this disclosure, with effect from 1 January 2014, the reforms of the accord by the Basel Committee ("Basel 3") were implemented in the EU legal framework. In order to comply with the new rules envisaged by Basel 3, the Group has undertaken adequate project initiatives,

expanding the objectives of the Basel 2 Project in order to improve the measurement systems and the related risk management systems.

With respect to credit risks, the Group received authorisation to use internal ratings-based approaches effective from the report as at 31 December 2008 on the Corporate portfolio for a scope extending to the Parent Company, network banks in the Banca dei Territori Division and the main Italian product companies.

Progressively, the scope of application has been gradually extended to include the SME Retail and Retail Mortgage portfolios, as well as other Italian and international Group companies, as shown in the following table.

	Corp	Corporate		Mortgage Retail
	FIRB	AIRB LGD	IRB LGD	IRB LGD
Intesa Sanpaolo				
Banco di Napoli				
Cassa di Risparmio del Veneto				
Cassa di Risparmio in Bologna	Dec - 2008	Dec - 2010	Dec - 2012	Jun - 2010
Cassa di Risparmio del Friuli Venezia Giulia				
Cassa dei Risparmi di Forlì e della Romagna				
Banca dell'Adriatico				
Mediocredito Italiano				n.a.
Gruppo Cassa di Risparmio di Firenze	Dec - 2009	Dec - 2010	Dec - 2012	Jun - 2010
Cassa di Risparmio dell'Umbria	n.a.	Dec - 2010	Dec - 2012	Dec - 2011
Banca Prossima	n.a.	Dec - 2013	Dec - 2013	n.a.
Banca IMI	n.a.	Jun - 2012	n.a.	n.a.
Intesa Sanpaolo Bank Ireland	Mar - 2010	Dec - 2011	n.a.	n.a.
Vseobecna Uverova Banka	Dec - 2010	Jun - 2014	Jun - 2014	Jun - 2012

Changes compared to the situation as at 31 December 2014 include the mergers by incorporation of Banca di Trento e Bolzano, Banca Monte Parma, Cassa di Risparmio di Rieti, Cassa di Risparmio della Provincia di Viterbo and Cassa di Risparmio di Civitavecchia (CRF Group) into the Parent Company Intesa Sanpaolo S.p.A.

Dedicated rating approaches have been developed for the Banks and Public Entities Portfolio according to the type of counterparty to be assessed. This was the subject of a pre-validation inspection by the Supervisory Authority conducted in December 2013, followed by an additional validation visit in March 2015. In the same month an AIRB authorisation request was presented to the Supervisory Authority for this portfolio.

The Group is also proceeding with development of the IRB systems for the other segments and the extension of the scope of companies for their application in accordance with a plan presented to the Supervisory Authority.

In relation to counterparty risk generated by OTC and SFT derivatives (Securities Financing Transactions), the Group has adopted over the last few years an evolved system for risk management and measurement, thanks to the development of a suitably robust IT, methodological and regulatory infrastructure, able to meet the use test requirement set out by the regulator for the application of the Internal Models Approach.

Potential future exposure (PFE) has been adopted by the Group for the purposes of operational measurement of uses of lines of credit for OTC and SFT derivatives.

For regulatory purposes, from March 2014, the requirement for counterparty risk is reported through the internal model for Parent Company and Banca IMI OTC derivatives, while for the rest of the group and for transactions in SFTs the authorisation request was submitted to the regulator during 2015.

With regard to Operational Risk, the Group obtained authorisation to use the Advanced Measurement Approach (AMA – internal model) to determine the associated capital requirement for regulatory purposes, with effect from the report as at 31 December 2009.

The adequacy of the internal control system for risks is also illustrated in the annual Internal Capital Adequacy Assessment Process Report, based on the extensive use of internal approaches for the measurement of risks and for the calculation of internal capital and total capital available. The document was approved and sent to the Supervisor in April 2015.

The internal control system

To ensure a sound and prudent management, Intesa Sanpaolo combines business profitability with an attentive risk-acceptance activity and an operating conduct based on fairness.

Therefore, the Bank, in line with legal and supervisory regulations in force and consistently with the Corporate Governance Code for Listed Companies, has adopted an internal control system capable of identifying, measuring and continuously monitoring the risks typical of its business activities.

Intesa Sanpaolo's internal control system is built around a set of rules, functions, structures, resources, processes and procedures aimed at ensuring, in compliance with sound and prudent management, the achievement of the following objectives:

- the verification of the implementation of Company strategies and policies;
- the containment of risk within the limits indicated in the reference framework for determining the Bank's risk appetite (Risk Appetite Framework RAF);
- the safeguarding of asset value and protection from losses;
- the effectiveness and efficiency of the Bank processes;
- the reliability and security of Company information and IT procedures;
- the prevention of the risk that the Bank may be involved, including involuntarily involved, in illegal activities (with special regard to those relating to money-laundering, usury and financing of terrorism);
- the compliance of transactions with the law and supervisory regulations, as well as internal policies, procedures and regulations.

The internal control system plays a crucial role and involves the entire corporate organisation (bodies, units, hierarchical levels, all personnel). In compliance with the provisions of Bank of Italy Circular 285/2013 (First Part, Title IV, Chapter 3) the "Integrated Internal Control System Regulation" was finalised. This aims to define the guidelines of Intesa Sanpaolo's internal control system, in its capacity as Bank and Parent Company of the Banking Group, through the adaptation of the reference principles and the definition of the responsibilities of the Bodies and of the functions with control duties, which contribute, in various ways, to the proper operation of the internal control system, as well as the identification of coordination arrangements and information flows supporting system integration. The structure of internal controls is also outlined by the entire set of company documentation (regulatory framework) that provides organised and systematic access to the guidelines, procedures, organisational structures, and risks and controls in force, incorporating all the Company policies, the instructions of the Supervisory Authorities, and provisions of law, including the principles laid down in Legislative Decree 231/2001 and Law 262/2005.

The regulatory framework consists of "Governance Documents" that oversee the operation of the Bank (Articles of Association, Code of Ethics, Group Regulations, Authorities and powers, Policies, Guidelines, Function charts of the Organisational Structures, Organisational Models, etc.) and of more strictly operational regulations that govern business processes, individual operations and the associated controls. More specifically, the Company rules set out organisational solutions that:

- ensure sufficient separation between the operational and control functions and prevent situations of conflict of interest in the assignment of responsibilities;
- are capable of adequately identifying, measuring and monitoring the main risks assumed in the various operational segments;
- enable the recording, with an adequate level of detail, of every operational event and, in particular, of every transaction, ensuring their correct allocation over time;
- guarantee reliable information systems and suitable reporting procedures for the various managerial levels assigned the functions of governance and control;
- allow the prompt notification to the appropriate levels within the Company and the swift handling of any anomalies found by the business units and the control functions;
- ensure adequate levels of business continuity.

The Company's organisational solutions also enable the uniform and formalised identification of responsibilities, particularly in relation to the tasks of controlling and correcting the irregularities found.

At Corporate Governance level, Intesa Sanpaolo has adopted a dual corporate governance system, in which the functions of control and strategic management, performed by the Supervisory Board, are

separated from the management of the Company, which is exercised by the Management Board in accordance with the provisions of art. 2409-octies et seq. of the Italian Civil Code and art. 147-ter et seq. of the Consolidated Law on Finance. The competent authorities have issued the required authorisation for the amendments to the Articles of Association relating to the adoption - effective from the date of renewal of the corporate bodies currently in office - of the one-tier governance system, approved by the Shareholders' Meeting of 26 February 2016.

The Supervisory Board established an Internal Control Committee within the Board (which replaced the Control Committee on 19 December 2014) which proposes, advises and enquires on matters regarding the internal control system.

The Committee also performs the duties and tasks of a Surveillance Body pursuant to Legislative Decree 231/2001 on the administrative liability of companies, supervising operations and compliance with the Organisational, Management and Control Model adopted by the Bank.

The Intesa Sanpaolo Group adopts an internal control system based on three levels, in line with the legal and regulatory provisions in force.

Such a model provides for the following types of control:

- Level I: line controls which are aimed at ensuring proper performance of operations (for example, hierarchical, systematic and sample-based controls) and which, to the extent possible, are incorporated in the IT procedures. These are conducted by the same operating and business structures, also through a unit dedicated exclusively to control duties or carried out by the back office;
- Level II: risk and compliance controls for the purpose of ensuring, inter alia:
 - o the correct implementation of the risk management process;
 - o compliance with the operating limits assigned to the various functions;
 - o compliance of company operations with the rules, including self-governance rules.

The functions assigned to such controls are separate from the ones in charge of production and contribute to the definition of the risk governance policies and the risk management process. In the Intesa Sanpaolo Group, Level II includes the following Parent Company structures and the equivalent local units of the Group companies, where established:

- Chief Compliance Officer, who is assigned the duties and responsibilities of the "compliance" function, as defined in the reference regulations. The Chief Compliance Officer's area also includes the Anti-Money Laundering Department, which is tasked with the duties and responsibilities of the "anti-money laundering function", as defined by the reference regulations;
- o as part of the Chief Risk Officer Governance Area, the Group Risk Manager and the Internal Validation Service, which, to the extent of their responsibilities, duly carry out the "risk management function" and the "validation function", respectively, as defined in the reference regulations.
- Level III: internal audit controls to identify breaches of procedures and regulations, as well as to periodically assess the completeness, adequacy, functionality (in terms of efficiency and effectiveness) and reliability of the organisational structure of the other components of the internal control system and the IT system at Group level, at scheduled deadlines in relation to the nature and intensity of the risks. In the Intesa Sanpaolo Group, internal auditing is carried out by the Internal Auditing Department of the Parent Company and the equivalent local units of Group companies, where established.

The internal control system is periodically reviewed and adapted in relation to business development and the reference context.

Intesa Sanpaolo has an internal control structure consistent with the indications provided by the Supervisory Authorities.

The Manager responsible for preparing the Company's financial reports

In July 2015 the Management Board, based on the opinion of the Supervisory Board, appointed Fabrizio Dabbene (until 30 June 2015 the office was held by Ernesto Riva) as the Manager responsible for preparing the Company's financial reports, pursuant to the provisions of Article 154-bis of the Consolidated Law on Finance.

The new Manager responsible for preparing the Company's financial reports, chosen among the Bank executives, meets specific professional requirements connected to adequate skills in financial and accounting disclosures, management or control of the related administrative procedures, as laid down by the Articles of Association. The Manager responsible for preparing the Company's financial reports also meets integrity requirements for members of control bodies of listed companies envisaged under current regulations.

The Manager responsible for preparing the Company's financial reports was vested with adequate powers and means for the performance of his/her functions. In this regard, he/she is provided with a structure that is adequate in terms of numbers, technical and professional skills and ongoing training programmes to support him/her in the fulfilment of his/her duties, with the cooperation of other structures of the Administration and Tax Department, as well as with the contribution of other corporate and control functions of the Parent Company and Group companies.

Supervision on the reliability of the company financial reports and on the financial reporting process is carried out in compliance with the provisions of Article 154-bis of the Consolidated Law on Finance and the related implementing provisions as well as the supervisory rules on the management and accounting system to which the companies that control companies governed by the laws of non-EU countries (Article 36 of Consob Market Regulation) are bound.

In order to comply with the aforesaid legal and regulatory provisions, the Manager responsible for preparing the Company's financial reports plays a steering and coordination role in Group companies with regard to administrative matters and in the supervision of internal control system functional to accounting and financial reporting and supervises the fulfilment of the obligations according to a shared approach at Group level, approved by the Management Board, with the favourable opinion of the Supervisory Board.

To this end, the Manager responsible for preparing the Company's financial reports:

- issues the instructions for the correct and uniform application of the accounting standards and measurement criteria, formalised as part of the Group Accounting Rules, subject to regular periodic updates;
- prepares appropriate administrative and accounting procedures regulating the preparation of the financial statements and the consolidated financial statements, taking care of their adaptation in relation to the corporate disclosure requirements applicable from time to time;
- oversees the consistency of the accounting statements contained in the corporate documents disclosed to the market; to this end, he/she has the power to promptly obtain any information deemed necessary for the performance of his/her duties and coordinates the exchange of information with the independent auditors;
- submits public disclosures to the Management Board and certifies the compliance of financial documents and reports in accordance with the provisions of Article 154-bis of the Consolidated Law on Finance.

With specific regard to the financial reporting process, the Manager responsible for preparing the Company's financial reports:

- maintains a system of information reports and flows with the Parent Company and the Company functions, in order to ensure the adequacy of balance sheet, income statement and financial positions and the descriptions of the main risks and uncertainties to which the Group may be exposed, monitoring the reliability of the relative data acquisition process and the process of disclosure of the relevant information;
- oversees the internal control system on the financial reporting process, drawing up audit plans to
 ensure the adequacy and effective application of management and accounting procedures over the
 period, also by subsidiaries subject to the laws of countries that are not European Union Member
 States, in accordance with the provisions laid down by Article 36 of the Consob Market Regulation;
 periodically reports to the Management Board and the Internal Control Committee on the scope and
 results of the audits;
- acquires any recommendations formulated by the independent auditors at the end of the process of auditing the Parent Company's financial statements and the consolidated financial statements, as well as the related feedback in terms of activated imporvement measures, monitoring their implementation and effectiveness;
- shares with the Surveillance Body, pursuant to Law 231 the findings of the audit plan carried out in implementation of the monitoring of the financial reporting process, with specific focus on preventing the criminal and administrative offences described in the "Organisation, Management and Control Model pursuant to Legislative Decree 231 of 8 June 2001" in information disclosure and external communications processes.

In relation to the supervisory and monitoring functions assigned, the Manager responsible for preparing the Company's financial reports:

- signs, jointly with the Managing Director, the statutory attestation (Art. 154-bis, paragraph 5 of the Consolidated Law on Finance) certifying the adequacy of the management and accounting procedures and the efficiency of the controls on the financial reporting, the compliance of the financial statement documents with the records, books and accounts and their capacity to give a true and fair view of the information on balance sheet, income statement and financial position and on the main risks to which the Group is exposed;
- certifies that the documents and communications circulated to the public meet the requirements of Art. 154-bis, paragraph 2) of the Consolidated Law on Finance;
- prepares a report regarding the outcome of the assessments to be submitted to the Managing Director and the Management Board, in order to allow the Administrative Body of the Parent Company to certify the compliance of the management and accounting system of the companies governed by the laws of non-EU countries (Article 36 of the Consob Market Regulation);
- prepares the periodic communication flows towards the Corporate Bodies in compliance with legal and regulatory obligations, also coordinating the periodic exchange of information with the independent auditors.

Furthermore, the Manager responsible for preparing the Company's financial reports monitors the assignments granted to independent auditors to supervise the auditors' independence and impartiality, in compliance with legal provisions and in accordance with methods governed by the specific Company Regulations.

The Manager responsible for preparing the Company's financial reports oversees the periodic reports that enable the Management Board to fulfil its legal and regulatory obligations, thereby monitoring the adequacy of powers and means granted. These reports are also submitted to the Control Committee, which reports to the Supervisory Board in order for it to perform its supervisory task of monitoring the financial reporting system, as required by law and the Articles of Association.

The financial reporting process monitoring

Within Intesa Sanpaolo, the monitoring of the accounting and financial reporting process is based on the review of:

- the completeness and consistency of the information disclosed to the market through a structured system of information flows coming from the functions of the Parent Company and Group companies on the significant events for the purposes of accounting and financial reporting, especially as regards the main risks and uncertainties to which they are exposed;
- compliance of the processes and procedures used for the preparation of the company financial reports, in particular, the consistency of the auditing approach and the proper conduct of the activities functional to the financial reporting process; the focus of the audits is represented by the work stages which, within business processes, entail the recording, processing, evaluation and presentation of data and information, as well as of the IT architecture and application monitoring rules, especially with reference to the management of operations and development interventions on the summary systems instrumental to the financial reporting process.

As known, the Italian legislation does not make express reference to predefined standards in order to assess the adequacy of the management and accounting procedures and to ensure the effectiveness of the internal control system over the financial reporting process. The international benchmark - which normally constitutes also a common reference for independent auditors - is represented by the COSO Framework and the COBIT Framework¹. They are also used as benchmarks by Intesa Sanpaolo insofar as they offer the opportunity for a convergence in the analysis and evaluation methodologies compared to the more widespread consolidated practices at the international level, based on authoritative references and widely recognised, updated on an ongoing basis and accompanied by elements of interpretation that enable a smooth and straightforward dialogue with the regulators, the independent auditors, the relevant bodies and among the control functions.

¹ The COSO Framework was prepared by the Committee of Sponsoring Organizations of the Treadway Commission, the U.S. organisation dedicated to improving the quality of financial reporting through ethical standards and an effective system for corporate governance and organisation. The COBIT Framework - Control Objectives for IT and related technology is a set of rules prepared by the IT Governance Institute, the U.S. organisation whose aim is to define and improve the standards of corporate IT.

The methodologies adopted for the purpose of monitoring the financial reporting process entail:

- the determination of the existence and compliance of the internal control system at corporate level, through the examination, conducted by the internal audit Function, of the governance systems, the presence and dissemination of standards of conduct inspired by ethics and integrity, the consistency of the organisational structures and transparent attribution of powers and responsibilities, the effectiveness of risk policies, the soundness of fraud prevention systems and the impact of codes of conduct and personnel disciplinary systems;
- the formalisation of relevant business processes for financial reporting purposes, with special focus on the risks and controls that define the stages of recording, processing, evaluation and presentation of data and information conducive to the preparation of Company financial reports and financial market disclosures; in addition to financial reporting processes (e.g. accounting, budget, reporting, management control, risk control) business processes (e.g.: credit, finance, asset management, insurance etc.) are also included, with reference to the assessment and reporting of assets and liabilities recorded in the accounting books and presented in corporate documents and operations processes in support of transactional and administrative data;
- the performance of an annual audit plan to certify the adequacy of the procedures and the effectiveness of the controls in place, by verifying the methodologies that govern the management of transactions within the scope of business processes and the forms of monitoring of the stages associated with the recording, evaluation and presentation of accounting data and financial information;
- the conduct of an annual audit plan to certify the systematic application of IT architecture governance rules with reference to the processing steps instrumental to the preparation of accounting and financial reports;
- the periodic preparation, for each significant Group Company, of an internal control system report on the financial reporting process, which sets out the main profiles of operational complexity, indicating the organisational set-up and the application architectures instrumental to the financial reporting process, together with the related control procedures as well as the findings of audits conducted during the year, indicating any shortcomings found and action taken to remedy them;
- the formulation of an opinion on the internal control system of the financial reporting process, upon the outcome of the monitoring over the correct implementation of the regulations, the audits conducted on the scope of companies and the performance of the evaluation process on a consolidated basis, considering the material nature of the shortcomings found in relation to the consolidated financial statements;
- the management of the communication processes between the Manager responsible for preparing the Company's financial reports and the Control Bodies, the corporate Control Functions and Internal Auditing function, in accordance with the provisions set out in the Regulations on the integrated internal control system;
- the management of the communication processes between the Manager responsible for preparing the Company's financial reports and the corporate bodies and independent auditors pertaining to legal and regulatory obligations.

The model used allows to achieve a reasonable guarantee as to the reliability of the accounting and financial reporting process; however, as evidenced by the COSO Framework, any internal control system, albeit well designed and operating continuously, cannot completely exclude the existence of malfunctions or fraud with a potential impact on the quality of the company financial reports; in relation to the legal and corporate representation of the documents, the correctness of the entries and the accuracy of the statements is also subject to an independent review by the independent auditors, which liaise with the Manager responsible for preparing the Company's financial reports on an ongoing basis.

The Group Risk Manager

The Group Risk Manager's area is responsible for operational implementation of the strategic and management guidelines for risk along the Bank's entire decision-making chain, down to individual operational units.

The tasks and functions are discussed in detail in the subsequent sections of this document.

Through the Controls Department, the Group Risk Manager's area carries out level II monitoring and controls over credit and other risks. The activities conducted on credit consider the quality, composition and evolution of the various loan portfolios, also through risk-based controls for the purpose of correctly

classifying and assessing single names. It also carries out monitoring and control of the rating allocation and update processes.

In general, the development of the audit activities includes an examination of the individual credit processes also in order to verify that suitable level I controls are in place, including implementation and traceability methods.

Internal Validation

The internal control system implemented by the Bank includes the validation function, the purpose of which is ongoing evaluation, in accordance with the Supervisory Regulations for banks², of the compliance of internal risk measurement and management systems over time as regards determination of the capital requirements with regulatory provisions, Company needs and changes in the market of reference. The validation function is entrusted to Internal Validation, which is responsible for the activity at the Group level in accordance with the requirements of supervisory regulations governing uniform management of the control process on internal risk measurement systems. The Internal Validation Service reports directly to the Chief Risk Officer and is independent of the units that manage internal system development activities and the internal auditing department. It ensures that internal models, whether already operational or in the development stages, are validated with regard to all risk profiles covered by Pillars 1 and 2 of the Basel Accord, in accordance with the independence requirements established by the reference regulations.

The validation process is mainly driven by Intesa Sanpaolo's roll-out plan and any requests coming from the Regulator. On an annual basis, the Internal Validation Service prepares a validation plan that is submitted to the Management Board and the Supervisory Board for approval.

With respect to Pillar 1 risks, validation is a prerequisite for use of the internal systems for regulatory purposes. The validation function conducts assessments of risk management and measurement systems in terms of models, processes, information technology infrastructure and their compliance over time with regulatory provisions, company needs and changes in the market of reference. The level of involvement of the structure depends on the different types of validation (development/adoption of internal systems, application for adoption/extension of internal systems, application for model change and ongoing validation).

Both during the initial application phase and on an ongoing basis (at least annually), the results of the Internal Validation Service's activities are presented to the competent functions, transmitted to the Internal Auditing Department for its related internal auditing work, as well as to the competent Managerial Committees and Governance Bodies for approval of the certification of compliance of internal systems with regulatory requirements, and forwarded to the Supervisory Authorities.

With respect to Pillar 2 risks, the Internal Validation Service conducts analyses of methodologies, verifying in particular that the measurement or assessment metrics adopted in quantifying significant risks are economically and statistically consistent, the methodologies adopted and estimates produced to measure and assess significant risks are robust and comparing alternative methodologies for measuring and aggregating individual risks. The analyses are conducted both in advance, when adopting/modifying the internal systems used for Pillar 2 purposes, and ex post as part of the prudential control process. The latter are summarised in the ICAAP report while, for substantial or significant modifications of internal systems, the Internal Validation Service produces a report to be submitted to the competent Managerial Committees and the Governance Bodies³.

The function also manages the internal validation process at the Group level, interacting with the Supervisory Authorities, the Corporate Bodies of reference and the functions responsible for the level III controls provided for in regulations. The Internal Validation Service adopts a decentralised approach for companies with local validation functions⁴ (certain international companies), coordinating and supervising the activities of such companies, and a centralised approach for the others. The adopted methodologies were developed in implementation of the principles that inspire the Supervisory Provisions for banks, UE directives and regulations, general orientations of international committees and best practices in the area and take the form of documentary, empirical and operating practice analyses.

² EU Regulation 575/2013 (CRR), EBA Guidelines, EU Directive 2013/36 (CRD IV), Bank of Italy Circular 285/2013.

In the event of substantial/significant modifications, the approval process requires that the Group Risk Manager submit updates to the Internal Management System, accompanied by the impact analysis on the risk metrics and the report of the validation unit, to the competent Managerial Committee for approval. Subsequently, reporting is drawn up on those modifications to the Management Board and the Supervisory Board.

Note that the functional reporting of local validation units to the Internal Validation Service has been formalised

The function generally also provides advice and suggestions to company and Group functions on an ongoing basis with the aim of improving the efficacy of the processes of risk management, control and governance of internal risk measurement and management systems for determining capital requirements. Finally, the Internal Validation Service is responsible for the validation of the internal systems used for management purposes and contributes to the risk model development process⁵ for both Pillar 1 and Pillar 2 risks.

In 2015, the main validation activities in the area of credit risks pertained to analyses for the submission of the following applications:

- adoption of the AIRB internal system for the Institutions segment (Banks and Public-sector Entities);
- adoption of internal estimates of PD for the Banking Book Equity portfolio;
- extension of the AIRB internal system to the subsidiary Provis;
- model change of the AIRB internal system for the Regulatory Corporate segment.

The following ongoing analyses were also conducted, and their results were summarised in the annual validation report:

- half-yearly backtesting analyses of regulatory segments authorised to use internal systems (residential mortgages for individuals, Corporate and Retail SME segments);
- half-yearly analyses on guarantees used to mitigate credit risk (mortgage, personal and financial guarantees).
- yearly quantitative and qualitative analyses (performance analyses and empirical analyses of use tests)
 for regulatory segments authorised to use internal systems.

In the cases of the international subsidiaries, Internal Validation conducted its own assessments in collaboration with the local validation functions, where present. In detail, analyses of the adequacy of internal credit risk measurement systems were conducted for the following subsidiaries:

- VUB (Slovakia): validation report for application for model change on residential mortgages to individuals and for extending the IRB approach to non-residential mortgages. Reports for the operational adoption of the Retail Unsecured model. Support for the model change for the Large Corporate segment (former IALC);
- PBZ (Croatia): validation report for the application of the FIRB approach for the Corporate segment and the IRB approach for Mortgages;
- CIB (Hungary): reports for the operational adoption of the Micro and Individual and Private Entrepreneur models and support to the local validation function for the tests regarding the PD and LGD Corporate models;
- BIB (Serbia): reports for the operational adoption of the Small Business Double & Single Entry model and the Specialized Lending slotting model;
- Banka Koper (Slovenia): validation report for the application of the FIRB approach for the Corporate segment;
- Intesa Sanpaolo Luxembourg (former SEB): validation report for the application for model change for the Large Corporate segment.

Validation activities for operational risk conducted in 2015 took the form of:

- verification of the strength of the model in the event of updating of the loss data during 2014 (internal and external data);
- ongoing validation analyses for the purpose of drawing up the annual report including the activity of replicating and verifying the database used by the calculation engine to quantify capital requirements.
 To that end, the information drawn from documentary and empirical analyses was supplemented by:
 - onsite inspections on the Corporate and Investment Banking Division and the international subsidiary banks included in the AMA scope (Advanced Measurement Approach with the support of the local validation functions), to verify the actual application of the process of operational risk monitoring and management and methodological analyses. A specific onsite inspection was also conducted at the subsidiary CIB for the purpose of the AMA application planned for 2015 and then postponed to the first half of 2016. An onsite inspection was also conducted at Banca IMI, which will be formally reported on in the first quarter of 2016;
 - Remote Verification Process on the Organisational Units/Legal Entities within the AMA scope, completed in the first half of 2015.

⁵ Model risk is intended as the risk that the model could become unsuitable or could be used incorrectly to describe - in a simplified but accurate manner - the real phenomenon for which it was developed.

The activity of the Internal Validation Service relating to the market risk component focused on the following areas:

- periodic quantitative and qualitative analysis as part of the ongoing valuation activity (in particular, backtesting of the Value at Risk (VaR) model and stress testing of the Incremental Risk Charge (IRC) model);
- monitoring of the existing model for calculating stressed VaR, which entails a half-yearly revision of the adequacy of the historical stress period to be used in the calculation;
- verifications conducted to support the request to revise the add-ons defined by the Bank of Italy, to calculate the capital requirement for market risk using the internal model, in relation to the completion of the corrective measures requested.

In addition, the Internal Validation Service carries out ongoing activities concerning pricing issues (for example, verification of the consistency of non-contributed bonds pricing among the end of quarter measurements carried out by the Financial and Market Risks Department, and operational pricing, monitored by Product Control of Banca IMI). With regard to the MAF (Managed Account Funds) portfolio, the Internal Validation Service produced detailed backtesting analyses, both for individual funds and for individual strategies.

In relation to counterparty risk, the Internal Validation Service periodically monitors the progress of corrective measures implemented for the findings reported in the authorisation letter and conducts periodic quantitative and qualitative analyses, whose results were summarised in the annual validation report.

In 2015, the main validation activities pertained to analyses for the submission of the following applications:

- model change, only in relation to quantitative aspects, for the EPE internal model of Banca IMI and Intesa Sanpaolo;
- extension of the EPE advanced approach to OTC derivatives of the Banks of the Banca dei Territori Division and the companies within this scope (Banca Prossima, Mediocredito and Intesa Sanpaolo Private Banking);
- extension of the EPE advanced approach to SFT instruments of Banca IMI and Intesa Sanpaolo.

With regard to Pillar 2 risks, in 2015 the following analyses were conducted to assess the methods to be used to calculate economic capital:

- impact analysis on the use of reporting metrics in the portfolio model following the comparison and reconciliation of reporting and operational measures carried out by the development function;
- analysis of economic capital calculated for Pillar 2 credit risk (i.e., including the additional components compared to Pillar 1, for example, the concentration component) for International banks and comparison with the economic capital used for local ICAAP (Internal Capital Adequacy Assessment Process) reporting;
- in the area of interest rate risk in the banking book, behavioural model analyses of prepayment (changed during 2015) and model analyses of demand items for the international subsidiaries CIB and VUB. In the last quarter of 2015, analyses were also initiated on the IRRBB framework (Interest Rate Risk in the Banking Book) to quantify the economic capital⁶;
- assessment of the changes in approach adopted during the last ICAAP report compared to the previous year (for example, change in the confidence interval, change in the holding period for market risk, elimination of the risk integration mechanism);
- assessments of the changes to the default loans model⁷;
- assessment of the corrective measures implemented or under way on findings of the Internal Valuation Service during the previous ICAAP report.

Moreover, in 2015, the development function conducted the annual valuation of the stability of the parameters of the model for demand deposits to quantify shift sensitivity.

Lastly, in line with the regulatory requirements implemented by the Group in the "Guidelines for the adoption, management and control of internal risk measurement systems used for management purposes", in June 2015, the annual report on internal systems used for management (non-regulatory)

 $^{^{6}}$ The outcome of these analyses will be formally recorded in the 2015/2016 ICAAP year.

⁷ Note that the model for quantifying economic capital of default loans was used under Pillar 1 to calculate the downturn component for LGD on reestimating the Corporate model.

purposes was drawn up. Specifically, the following were analysed:

- pricing models for credit products and calculation of EVA;
- behavioural models to quantify banking book interest rate risk (prepayment and demand deposits);
- market risk models;
- counterparty risk models.

Compliance

The governance of compliance risk is of strategic importance to the Intesa Sanpaolo Group as it considers compliance with the regulations and fairness in business to be fundamental to the conduct of banking operations, which by nature is founded on trust.

The responsibilities and duties of the compliance function are assigned to the Chief Compliance Officer, who is independent and autonomous in relation to the operational structures, reports directly to the Governing Bodies and has access to all activities within the Bank, as well as any significant information for the performance of his/her duties.

The Group's Compliance Model is set out in the Guidelines approved by Intesa Sanpaolo's Management Board and Supervisory Board, which indicate the responsibilities of the various company structures and macro processes to mitigate compliance risk:

- identifying and assessing compliance risk;
- proposing the functional and organisational measures for mitigation of this risk;
- assessing the consistency of the company's bonus system;
- conducting pre-assessments of the compliance of innovative projects, operations and new products and services;
- providing advice and assistance to the governing bodies and the business units in all areas with significant compliance risk;
- monitoring, including through the use of information provided by the other control functions, of ongoing compliance;
- promoting a corporate culture founded on the principles of honesty, fairness and respect for the spirit and the letter of the rules.

The regulatory scope and the procedures for monitoring regulatory areas that present significant risks of non-compliance for the Group are defined in the Group Compliance Guidelines. The Chief Compliance Officer submits periodic reports to corporate bodies on the adequacy of compliance control, with regard to all regulatory aspects applicable to the Bank which show compliance risks. On an annual basis, these reports include an identification and assessment of the primary compliance risks to which the Group is exposed and a schedule of the associated management measures, and on a half-yearly basis they include a description of the activities performed, critical issues noted, and remedies identified. A specific notice is also given when events of particular significance occur.

The Compliance Guidelines call for the adoption of two distinct models in relation to direction and control of the Group. These models are organised in such a way as to account for the Intesa Sanpaolo Group's structure in operational and territorial terms. In particular:

- compliance supervision activities for specifically identified Network Banks and Italian Companies whose operations show a high degree of integration with the Parent Company are centralised with the Chief Compliance Officer structures;
- for the other Companies, specifically identified on the basis of the existence of a legal obligation or due to the importance of their material size and/or risk, as well as for International Branches, an internal compliance function is established and a local Compliance Officer is appointed, which are assigned compliance responsibilities. The local Compliance Officers of the subsidiaries functionally report to the Chief Compliance Officer structures, while those of the International Branches, except where not permitted by local regulations, hierarchically report to the Chief Compliance Officer structures.

The activities carried out during the year concentrated on the regulatory areas are considered to be the most significant in terms of compliance risk, including the most significant ongoing projects that are part of the Company Strategic Plan, as well as the measures to comply with regulations enacted at an international level. In particular:

— with regard to investment services, monitoring of the procedural organisational structure in support of the service model adopted by the Bank continued, also in light of the Consob Communication on the distribution of Complex Financial Products to retail customers, and the new European rules on the resolution of banking crises (BRRD) and the related obligations of adequacy assessment and disclosure to customers. A project of adjustment to new European regulations (MiFID 2 and MiFIR, MAD 2 and MAR), which entail significant changes to the current regulations, was also launched. Work also continued in the areas of monitoring personal transactions, controlling customer operations in order to prevent market abuse, managing conflicts of interest and the circulation of insider information;

- as regards banking products and services, the IT systems were integrated to implement the prohibition
 of bank anatocism, pending the expected CICR resolution to complete the new approach, and the
 adjustment to the European sector rules was begun (Mortgage Credit Directive on credit agreements
 for consumers relating to residential immovable property, Payment Accounts Directive, Regulation on
 card-based payment transactions);
- with regard to insurance and pension-related intermediation, the reinforcement of compliance risk monitoring continued in relation to the distribution of policies that can be associated with loans, based on the indications issued by the Bank of Italy and IVASS;
- compliance controls were defined and implemented for new services (Real Estate and e-commerce) and channels (out-of-branch and remote offerings) which enhance the content and methods of offerings to customers;
- the organisational, management and control Model pursuant to Italian Legislative Decree 231/2001 was overseen by verifying its compliance with the Company regulations and coordinating verification of its proper implementation;
- among "non core" regulations, specific focus was placed on the Tax and ICT areas.

Additional activities were aimed at reinforcing management and coordination activity for Italian and international subsidiaries and international branches, with the aim of implementing a supervisory model comparable to that adopted by the Parent Company.

Lastly, considerable importance was attached to personnel training programmes, involving the implementation, in collaboration with the competent Company functions, of initiatives aimed at predefined targets in order to maximise their effectiveness.

Anti-Money Laundering

The duties and responsibilities of the Anti-Money Laundering Function, as envisaged by regulations, are assigned to the Anti-Money Laundering Department, which, following the reorganisation implemented in July 2015, reports directly to the Chief Compliance Officer.

Specifically, the Anti-Money Laundering Department ensures monitoring of compliance risk in the area of money laundering, combating financing of terrorism and embargo management by:

- laying down the general principles to be adopted within the Group for the management of compliance risk;
- conducting ongoing monitoring, with the support of the competent functions, of developments in the national and international context of reference, verifying the adequacy of company processes and procedures with respect to applicable regulations and proposing appropriate organisational and procedural changes;
- providing advice to the functions of the Parent Company and subsidiaries on a centralised basis and establishing adequate training plans;
- preparing appropriate periodic reporting for corporate bodies and top management;
- discharging the required specific obligations on behalf of the Parent Company and subsidiaries on a centralised basis, including, in particular, enhanced customer reviews, controls of proper management of the Single Electronic Archive and the assessment and monthly submission to the Financial Reporting Unit of data relating to aggregated anti-money laundering reports, and the assessment reports of suspicious transactions received from operating departments for the submission to the Financial Reporting Unit of reports deemed accurate.

During 2015 the Anti-Money Laundering function devoted the utmost attention to projects aimed at reinforcing coverage of the Group's Italian and international companies, also in light of the new indications from the Supervisory Authorities, with a view to organisational, regulatory and procedural compliance to the standards of the Parent Company. The strict monitoring of cash transactions continued, including those routed through payment cards, and customised measures were implemented to mitigate the typical risks of transactions of parties operating in specific sectors (for ex. "gold buying" and "gaming").

Internal Auditing

Internal auditing activities are performed by the Internal Auditing Department, which reports directly to the Chairman of the Management Board and the Chairman of the Supervisory Board. It also functionally reports to the Internal Control Committee and has no direct operating responsibilities.

The Department has a structure and a control model which is organised consistently with the evolution of the organisational model of Intesa Sanpaolo and of the Group.

The Internal Auditing structures of the Group's Italian and international companies report to the Internal Auditing Department in terms of functions.

The Internal Auditing Department performs overall level 3 assessment of the internal control system, reporting possible improvements to the corporate bodies, with specific regard to the RAF, the risk management process and risk measurement and control instruments.

In particular, the Department assesses the completeness, adequacy, functionality and reliability of the components of the internal control system, the risk management process and the corporate processes, also with regard to their ability to identify and prevent errors and irregularities. In this context, amongst others, it audits the risk control and regulatory compliance corporate functions, also through participation in plans so as to generate added value and improve the effectiveness of the control and corporate governance processes. The audit action directly concerns Intesa Sanpaolo and the Group companies.

The Internal Auditing Department is also responsible for assessing the effectiveness of the corporate RAF definition process, the internal consistency of the overall framework and compliance of Bank operations with the RAF.

The Head of the Internal Auditing Department enjoys due autonomy and independence from the operating departments. The Department has free access to the activities, data and documents of all company functions.

The Department uses personnel with the appropriate professional skills and expertise and ensures that its activities are performed in accordance with international best practices and standards for internal auditing established by the Institute of Internal Auditors (IIA).

The Department has earned the maximum rating ("Generally Compliant") in the external Quality Assurance Review envisaged by the international standards.

In performing its duties, the Department uses structured risk assessment methods to identify existing situations of greatest interest and the main new risk factors. Based on the assessments emerging from risk assessment and the resulting priorities, as well as on any specific requests for further enquiry expressed by top executive positions and corporate bodies, it prepares and submits an Annual Intervention Plan for prior examination by the Internal Control Committee, and subsequent approval by the Supervisory Board, on the basis of which it conducts its activities during the year, as well as a Multi-Year Plan with the hedging commitments.

During 2015, auditing was performed directly for the Parent Company, Intesa Sanpaolo, the Network Banks and other subsidiaries under an outsourcing contract. For the other Group companies with their own internal audit departments, controls were conducted (indirect surveillance).

Audits were primarily aimed at monitoring the evolution of the risks associated with credit quality, internal capital adequacy estimation criteria and international activities. Particular attention was also devoted to the themes of compliance with money laundering prevention regulations.

Control activity was generally oriented towards the processes carried out by company functions with the aim of assessing:

- the functionality of line and second-level controls;
- the reliability of operating departments and delegation mechanisms;
- the accuracy of the information available in the various activities and the adequate use of the same.

Direct surveillance, both on-site and remote, was carried out in particular through supervision of processes relating to:

- credit granting, management and classification, verifying its adequacy with respect to the risk control system and the functioning of measurement mechanisms in place;
- measurement, management and control of the Group's exposure to various market, counterparty, liquidity, interest rate, operational and credit risks. Particular attention was dedicated to the adequacy of the processes and criteria for estimating internal capital with respect to the Risk Appetite Framework as well as in accordance with the Prudential Supervisory regulations;
- controls carried out by compliance risks governance functions and operating functions, in particular
 on provisions of law concerning money laundering, investment services, transactions with related
 parties and the administrative liability of entities pursuant to Legislative Decree 231/01;
- IT system development and management, to ensure their reliability, security and functionality;
- management of financial operations with the aim of verifying the adequacy of related risk control systems;
- management of operations.

Control activity was then completed through:

- measures affecting Italian product company subsidiaries, with a priority focus on credit quality and processes, as well as on money laundering prevention and embargo processes;
- verification of the operations performed by international banks, companies and branches, with interventions by both local internal auditors and internal auditors from the Parent Company;
- control of the governance activity performed by the Parent Company for the International Subsidiary Banks;
- timely performance of the assessments requested by the Supervisory Authorities in specific areas such
 as management remuneration and incentive systems, the Parent Company's management and
 coordination powers over asset management companies, obligations under new authorisations,
 privacy, business continuity and provisioning for doubtful loans.

Indirect audit was conducted via the steering and practical coordination of the auditing departments of Italian and international subsidiary banks and companies, to guarantee control consistency and adequate attention to the different types of risks, also verifying the effectiveness and efficiency levels under both structural and operational profiles. Direct auditing and review activities, in the capacity of Parent Company, was also performed for those companies, as mentioned above.

Any weaknesses detected during control activities have been systematically notified to the company functions involved for prompt improvement actions, which are monitored by follow-up activities to verify their effectiveness.

Summary internal control system assessments from the checks have been periodically submitted to the Internal Control Committee, Management Board and Supervisory Board. The main weaknesses detected and their development over time have been included in the Audit Tableau de Bord (TdB) so that they may be systematically monitored. The reports relating to the actions completed with a negative opinion or which highlight major shortcomings were submitted in full to the Supervisory Board and the Management Board of the Parent Company as well as to the Boards of Directors and Statutory Auditors of the subsidiaries concerned.

Lastly, the Internal Auditing Department ensured constant assessment of its own effectiveness and efficiency in line with the internal "quality assurance and improvement" plan drafted in accordance with the recommendations of international standards for professional audit practice. In this regard, during 2015 it pursued an evolutionary path with the aim of strengthening the audit model in line with the new European supervisory standards laid down by the EBA (SREP framework).

Independent Auditing

For Intesa Sanpaolo, as a listed company (Public Interest Entity pursuant to the relevant regulations), auditing of the accounts may only be conducted by an independent auditing firm (Auditor), responsible for verifying, during the year, the regular keeping of corporate accounts and the proper recording of management operations in the books, and for expressing, through the appropriate reports, an opinion on the Parent Company's and consolidated financial statements, as well as on the half-yearly report, after ascertaining that they correspond to the accounting entries and related audits and that such records comply with the relevant regulations.

The independent auditors are KPMG S.p.A., to which the ordinary Shareholders' Meeting of 10 May 2011 awarded the engagement for financial years 2012-2020, on proposal of the Supervisory Board.

In order to monitor compliance with laws governing independent auditors engaged for the auditing of the accounts of Group companies, while ensuring the conditions to protect the independence of independent auditors, Intesa Sanpaolo has adopted specific Group Regulations used to introduce a supervisory system aimed at monitoring the appointment of independent auditors and other engagements awarded by the Parent Company's Departments and Group companies to independent auditors, their business networks and their affiliates, in accordance with the guidelines set forth by the Management Board and Supervisory Board.

Based on current Group provisions, the appointment of independent auditors by Parent Company Departments and Group companies to provide services other than accounting audits requires prior examination by the Manager responsible for preparing the Parent Company's financial reports and by the Parent Company's Control Committee or Board of Statutory Auditors of the company concerned. The Manager responsible for preparing the Company's financial reports is also responsible for reporting to the Control Committee, the Supervisory Board and the Management Board on a periodic basis on

assignments awarded during the period to the independent auditors of the Parent Company and other Group companies by the Group and the fees paid to them over the year.

CREDIT RISK

Risk management strategies and processes

The Group's strategies, powers and rules for the granting and managing of loans are aimed at:

- achieving sustainable growth of lending operations consistent with the risk appetite and value creation;
- diversifying the portfolio, limiting the concentration of exposures on single counterparties/groups, single economic sectors or geographical areas;
- efficiently selecting economic groups and individual borrowers through a thorough analysis of their creditworthiness aimed at limiting the risk of insolvency;
- given the current economic climate, privileging lending business aimed at supporting the real economy and production system;
- constantly monitoring relationships, through the use of both IT procedures and systematic surveillance
 of positions, with the aim of detecting any symptoms of imbalance and promoting corrective measures
 geared towards preventing possible deterioration of the relationship in a timely manner.

Constant monitoring of the quality of the loan portfolio is also pursued through specific operating checks for all the phases of loan management.

Credit granting autonomy limits, which incorporate the amount of loans granted (EAD), the risk level of the customer (PD), the loss rate in the event of a default by the borrower, possibly mitigated by the presence of guarantees (LGD), and maturity, are defined in terms of risk-weighted assets and reflect the risks assumed/to be assumed by the Intesa Sanpaolo Group towards the Economic Group.

Intesa Sanpaolo, as the Parent Company, has set out codes of conduct in relation to credit risk acceptance, in order to prevent excessive concentrations, limit potential losses and ensure credit quality. In the credit-granting phase, coordination mechanisms have been introduced with which Intesa Sanpaolo exercises its direction, governance and support of the Group:

- the system of Credit Powers and Granting and Monitoring Rules governing the ways in which credit risk to customers is assumed;
- the "Credit-granting limit", intended as the overall limit of lines of credit which may be granted by companies of the Intesa Sanpaolo Group to the larger Economic Groups;
- the "Compliance opinion" on credit-granting to large customers (single name or Economic Group) by Group subsidiaries which exceeds certain thresholds;
- the introduction of the "Rules on Credit Risk Appetite" aimed at regulating the application of the CRA in order to pursue a sustainable loan increase.

The exchange of basic information flows between different Group entities is assured by the Group's "Centrale Rischi" (exposure monitoring and control system) and by the "Posizione Complessiva di Rischio" (global risk position), which highlight and analyse credit risks for each counterparty/economic group both towards the Group as a whole and towards individual Group companies.

The activities within the Chief Risk Officer's purview are performed directly by the Credit Risk Management Department for both the Parent Company and the main subsidiaries, according to a service contract.

Structure and organisation of the associated risk management function

Within the Intesa Sanpaolo Group, a fundamental role in managing and controlling credit risk is played by the corporate bodies, which, to the extent of their respective competences, ensure adequate coverage of credit risk by setting strategic guidelines and risk management policies, verifying that they remain constantly efficient and effective and assigning tasks and responsibilities to the company functions and units involved in the processes.

The coverage and governance of credit ensured by the corporate bodies is reflected in the current organisational structure, which identifies areas of central responsibility attributable to:

- Chief Lending Officer
- Chief Risk Officer
- Chief Financial Officer

They ensure that risk control activities are managed and implemented, with an appropriate level of segregation.

The Chief Lending Officer assesses the creditworthiness of the loan applications received and, where competent, approves them or issues a compliance opinion. The chief Lending Officer manages and monitors non-performing loans, sets the Credit Granting and Management Rules, ensures that positions classified as non-performing, within his purview, are properly measured for financial statement purposes, and also defines operating credit processes, in collaboration with the subsidiary Intesa Sanpaolo Group Services, on some occasions at the proposal of the Group's various functions/structures.

The Chief Risk Officer is responsible for adapting the Risk Appetite Framework to the management of credit risk, in accordance with company strategies and objectives, as well as for measuring and controlling the Group's risk exposures, defines the metrics used to measure credit risk, provides risk-adjusted pricing models and guidelines for expected loss, economic capital (ECAP), RWA and acceptance thresholds; formulates proposals for assigning Credit Granting and Managing Powers, and implements level-two credit monitoring and controls, including rating controls. With specific regard to the collective measurement of performing loans and the measurement of non-performing loans on a statistical basis, he or she supervises credit risk measurement models.

In accordance with the strategic guidelines and risk management policies set by the Management Board and approved by the Supervisory Board, the Chief Financial Officer coordinates the process of formulating credit strategies (a process in which the other chiefs and the business units participate), oversees pricing from a risk/return standpoint according to value creation objectives. The Chief Financial Officer is also responsible for identifying and implementing hedging transactions for the risk exposures of the asset classes in the loan portfolio by taking advantage of the opportunities presented by the secondary credit market with a view towards active management of company value.

In addition, within the framework of the loan assessment process, the Administration and Tax Department, under the Chief Financial Officer, is responsible for incorporating the assessments of loan positions formulated, on a collective or individual basis, by the competent departments, as well as for coordinating the process of assessing loans for financial reporting purposes.

Intesa Sanpaolo Group Services provides specialised operating support for loan recovery activity and in defining credit processes while ensuring cost and performance synergies in the service offered.

Scope of application and characteristics of the risk measurement and reporting system

Intesa Sanpaolo has developed a set of instruments which ensure analytical control over the quality of loans to customers and financial institutions, and of exposures subject to country risk.

Risk measurement is performed by means of different rating models according to borrower segment (Corporate, Retail SME, Retail Mortgage, Other Retail, Sovereigns, Italian Public sector entities and Financial institutions). These models make it possible to summarise the counterparty's credit quality in a value, the rating, which reflects the probability of default over a period of one year, adjusted on the basis of the average level of the economic cycle. These ratings are then made comparable with those awarded by rating agencies, by means of a uniform scale of reference.

A number of rating models are used for the Corporate segment:

- models differentiated according to the market (domestic or international) and size bracket of the company are applied to most businesses;
- specific models are in use for specialised lending, one for real-estate initiatives, one for project-finance transactions and one for LBO/acquisition-finance and asset-finance transactions.

In general terms, the structure of these models requires the integration of multiple modules:

- a quantitative module that processes financial and behavioural data;
- a qualitative module that requires the manager to fill in a questionnaire;
- an independent assessment by the manager, organised as a structured process, which triggers the override procedure if there is a discrepancy with respect to the integrated rating.

Ratings are generally assigned on a decentralised basis by the Manager, who is the main figure in the process of assigning a rating to a counterparty. Any improvement override proposals are validated by a Specialist Unit allocated to the Parent Company, within the Chief Lending Officer's staff. The Specialist Unit is responsible for, among other duties, the task of assigning what are known as "centralised ratings" provided for in the rating assignment processes according to the corporate method and of intervening in the calculation of ratings with specialist models.

The models applied to the Retail portfolio are as follows:

for the Retail SME segment, since the end of 2008 a Group rating model by counterparty has been used, following a scheme similar to that of the Corporate segment, meaning that it is extremely decentralised and its quantitative-objective elements are supplemented by qualitative-subjective elements; in 2011, the service model for the Small Business segment was redefined, by introducing in particular a sub-segmentation of Micro and Core customers according to criteria of size, simplicity,

and a partial automation of the granting process. This required an adjustment of the rating model, which was divided into the two above-mentioned sub-segments, taking advantage of the opportunity to update the data sources and historical series used in development;

- for the Retail Mortgage segment (residential mortgages for private individuals), the Group model processes information relating to both the customer and the contract. It differentiates between initial disbursement, where the acceptance model is used, and the subsequent assessment during the lifetime of the mortgage (performance model), which takes into account behavioural data;
- for products aimed at individuals (the Other Retail segment), a new approval model was made available in September 2014 for operational purposes, which is applied to all new disbursements (such as personal loans, credit cards, and credit facilities on current accounts).

The PD rating models for the Corporate, Mortgage and SME Retail segments, which received authorisation to use the AIRB approach (effective the report as at 31 December 2011) and the IRB approach (effective the report as at 30 June 2010 for Mortgage and 31 December 2012 for SME Retail), respectively, are described in greater detail in the Section on IRB models.

As regards the other segments, a brief summary is provided below of the current status of the models and the expected developments. The use of internal models for operational purposes also extends to the segments where the internal ratings are not intended to be used for regulatory reporting.

The Banks model, in use from March 2011, is a "default model" which, with reference to the low default segment, has used both internal data and data on external defaults for its estimates.

From the standpoint of determining probability of default, the key decision was to differentiate the models for banks in mature economies and banks in emerging countries, the structure of which, however, is highly similar. In short, these consist of a quantitative part and a qualitative part, differentiated according to mature and emerging countries, a country rating component relating to systemic risk, a component relating to specific country risk for banks most closely correlated with country risk, and finally, a module (the "manager's opinion") that allows the rating to be modified in certain conditions.

In the Public Entities segment, the models of reference have been differentiated according to the type of counterparty. Accordingly, default models have been developed for municipalities and provinces and shadow rating models for regions. An approach to extend the rating of the regulatory Entity (Region, ...), has been adopted for local healthcare authorities and other sector entities, with possible changes on the basis of financial statement assessments (notching).

The rating model for the Sovereign portfolio supports the assignment of an assessment of creditworthiness for over 260 countries. The structure of the model involves:

- a quantitative module for assessing country risk, which takes account of the structural rating assigned by the major international agencies, the risk implicit in market quotations of sovereign debt, a macroeconomic assessment of countries identified as strategic and the international scenario;
- a qualitative opinion component, for which the Sovereign Rating Working Group is responsible, supplementing the qualitative opinion with elements drawn from the broader scope of publicly available information concerning the political and economic structure of individual sovereign countries.

For counterparties belonging to the Non-Banking Financial Institutions sub-segment (Insurance Companies, Credit Guarantee Consortia, etc.), for which the Permanent Partial Use has been requested, a series of exclusively operational models is already used or under development, based on a variety of statistical techniques (shadow rating, portfolio approaches) and supplemented by experience-based elements.

The LGD model is based on the concept of "Economic LGD", namely the present value of the cash flows obtained in the various phases of the recovery process net of any administrative costs directly attributable to the exposure as well as the indirect management costs incurred by the Group, and consists, in brief, of the following elements:

- estimate of a Doubtful LGD Model: starting from the LGD observed on the portfolio, namely "Workout LGD", determined on the basis of the recoveries and costs, a regression econometric model of the LGD is estimated on variables considered to be significant for the determination of the loss associated to the Default event;
- application of a correction factor, known as "Danger Rate": the Danger Rate is a multiplying correction factor, used to recalibrate Doubtful LGD with the information available on the other

- default events, in order to calculate an LGD representative of all the possible default events and their evolution;
- application of an additional correction factor, known as "Final Settlement Component": this
 component is used as an add-on to the estimate recalibrated for the Danger Rate in order to consider
 the loss rates associated with positions not evolved to the Doubtful status (Unlikely to pay or Past Due
 positions).

LGD is determined according to differentiated models, specialised by operating segment (Corporate, Retail SME, Retail Mortgage, Factoring, Leasing and Public Entities).

The Banks LGD model partly diverges from the models developed for the other segments, given the peculiarities of the segment, which has a low number of defaults ("low-default portfolios"). The estimation model is a market LGD approach, based on the market price of debt instruments observed 30 days after the official date of default for a sample of defaulted banks from all over the world. The market data are provided by an external provider. The model is completed by an econometric estimate aimed at determining the most significant drivers, in accordance with the practice in use for the other models. The LGD models for the Corporate, SME Retail and Retail Mortgage segments, for which the AIRB and IRB approaches, respectively, were approved, are described in further detail in the Section on IRB models.

PD and LGD models have been adopted for the counterparties of the International Subsidiary Banks, partly derived from the Parent Company and partly adapted to the local situation which was entirely developed by the subsidiaries concerned.

An application for authorisation to use the internal model to determine the EAD (exposure at default) and to adopt the IRB models for other retail loans, is to be submitted in 2016.

The rating system also includes a risk monitoring process, calculated on a monthly basis. It interacts with processes and procedures for loan management and credit risk control and allows timely assessments when any anomalies arise or persist. The positions to which the synthetic risk index attributes a high risk valuation, which is confirmed over time, are intercepted by the proactive Management Process. Starting from July 2014 the new Proactive Credit Management process was activated, setting up a specialised dedicated chain in the Regional Governance Centres, the CIB Division and the CLO structures. The objective is to promptly identify performing positions with early signs of difficulty and immediately implement the most suitable actions to remove the anomalies and restore the relationship of trust. The

introduction of proactive management also significantly simplified the processes and statuses of non-performing loans, eliminating the status of Risks Under Observation and introducing the new status of Restoration.

The project "IT Infrastructure in Support of the Single Supervisory Mechanism (SSM)", aimed at enhancing the infrastructure and processes developed during last year's comprehensive assessment, was launched during the year. The project involved, among other actions, the process called "Revision of Credit Interception System", aimed at developing current interception systems, including through the reproposal of the IRIS indicator, as well as the identification of the most significant impacts on credit processes. The first phase of the project, nearing completion, involved the inclusion of the AQR impairment triggers (high priority indicators) in the new interception system known as the "Early Warning System".

The entire loan portfolio is also subject to a specific periodic review carried out by the competent central or peripheral structures based on the credit line limits for each counterparty/economic group.

Through specific monitoring, control, guidance and coordination activities, the Controls Department oversees the credit granting and management processes for the performing loans portfolio at the Group level, including the proactive management process, in addition to assessing that loans are properly classified through controls of individual positions. It also carries out monitoring and control of the rating allocation and update processes.

Country risk is an additional component of an individual borrower's insolvency risk, measured by credit risk control systems. This component is linked to losses potentially resulting from international lending operations caused by events in a country that are partly or entirely within the control of the government concerned, but not that of the individual residents of the country in question. Country risk therefore takes the form of both transfer risk for non-sovereign counterparties, due to the freezing of international

payments, and sovereign risk, which is measured through an assessment of the sovereign states' creditworthiness. This definition includes all forms of cross-border lending to entities residing in a given country, whether they are the government, a bank, a private enterprise or an individual.

The country risk component is assessed in the context of the granting of credit to non-resident entities in order to obtain a preliminary evaluation of the absorption of country risk limits set on an ex-ante basis. Such limits, expressed in terms of economic capital, identify the maximum acceptable risk for the Group, defined on an annual basis as the result of an exercise aimed at optimising the risk implicit in the Group's cross-border lending operations.

Counterparty risk is a particular type of credit risk associated with OTC derivatives and SFTs (Securities Financing Transactions), such as repurchase agreements, securities lending, etc. For a more detailed discussion of this topic, see the dedicated Section of this document.

Directional control of credit risks is achieved through a portfolio model which summarises the information on asset quality in risk indicators, including expected loss and capital at risk.

The expected loss is the product of exposure at default, probability of default (derived from the rating) and Loss Given Default.

The expected loss represents the average of the loss statistical distribution, whereas the capital at risk is defined as the maximum "unexpected" loss that the Group may incur with particular confidence levels. These indicators are calculated with reference to the current status of the portfolio and on a dynamic basis, by determining the projected level, based on both the forecast macroeconomic scenario and on stress scenarios.

The expected loss, transformed into "incurred loss", as indicated by IAS 39, is used in the collective provisioning, while capital at risk is the fundamental element in the assessment of the Group's capital adequacy. Both indicators are also used in the value-based management reporting system.

The loan portfolio model allows the level of expected loss to be measured with the chosen confidence interval, or capital at risk. The latter reflects not only the risk level of individual counterparties but also the effects of undesired concentration due to the geographical/sector composition of the Group's loan portfolio.

The Group dedicates special attention to assessing concentration risk deriving from the exposure to counterparties, groups of related counterparties and counterparties in the same business segment or that engage in the same business or operate in the same geographical region. In the annual update of the Risk Appetite Framework, such counterparties are subject to stress tests aimed at identifying and assessing threats for the Group and the most appropriate mitigating actions:

- aimed at defining exposure limits for specific geographical areas and sets of counterparties (top 20);
- aimed at ex ante limitation of exposures with significant concentration effects, in particular with reference to "large risks" and to credit lines subject to country risk;
- aimed at ex post correction of the profile, through the secondary loan market, through specific judgement metrics based on the maximisation of overall portfolio value.

The Group's lending activity is focused on Italian customers (83% of the total) and is primarily aimed at households and small and medium enterprises. In addition, it shows strong diversification, especially as regards certain business sectors and geographical areas, as well as loans to countries at risk.

Policies for hedging and mitigating risk

Mitigation techniques are adopted in order to reduce the Loss Given Default. In particular, they include guarantees and certain types of contracts that result in a reduction in credit risk.

The evaluation of the mitigating factors is performed through a procedure that assigns a loss given default to each individual exposure, assuming the highest values in the case of ordinary non-guaranteed financing and decreasing in accordance with the strength given to any mitigating factors present. The Loss Given Default values are subsequently aggregated at customer level in order to provide a summary evaluation of the strength of the mitigating factors on the overall credit relation.

During the credit granting and managing process, the presence of mitigating factors is encouraged for counterparties with non-investment grade ratings or some types of transactions, namely medium-/long-term transactions.

The mitigating factors that have the greatest impact include pledges of financial assets and residential mortgages. Other forms of risk mitigation are pledges of non-financial assets and non-residential mortgages.

The strength of the personal guarantees issued by rated parties, typically banks/insurance companies, Credit Guarantee Consortia and corporations, is instead assessed on the basis of the type of guarantee and guarantor's credit quality.

Detailed processes govern the material acquisition of individual guarantees, identifying the responsible structures as well as the methods for correct finalisation of guarantees, for filing documentation and for complete and timely reporting of the related information in the applications.

The set of internal regulations and organisational and procedural controls is aimed at ensuring that:

- all the fulfilments are planned to ensure the validity and effectiveness of the credit protection;
- for generally and normally used guarantees, standard contracts are defined, accompanied by instructions for use;
- the methods for approving guarantee documents deviating from the standard by structures other than those in charge of commercial relations with the customer are identified.

An overall revision of the rules, processes and instruments concerning guarantees received and, more generally, instruments that mitigate credit risk is underway. The goal of these activities is to increase the efficiency of management, reduce the related operational risks and increase the level of eligibility of the guarantees. Following a detailed analysis, the requirements and architecture of a new application platform to manage all the phases in the lifecycle of a guarantee (acquisition, modification, extinction, enforcement, control, monitoring and custody) were defined.

Releases of the module for managing the personal guarantees of the Italian banks and international branches began in June 2015 and were completed in January 2016. Subsequent implementations, relating to real-estate and financial guarantees, will occur gradually, starting in the first quarter of 2016, with the creation of a Group register of assets used as collateral, leading up to the activation of the real estate collateral module, which will be completed by the third quarter of 2016.

The granting of credit with the acquisition of collateral is subject to internal rules and processes – for the evaluation of the asset, the acceptance of the guarantee and the control of its value. The enforcement of the guarantee is handled by specialist departments, which are responsible for credit recovery.

In any case, the presence of collateral does not grant exemption from an overall assessment of the credit risk, mainly concentrated on the borrower's ability to meet the obligations assumed, irrespective of the associated guarantee.

The assessment of the pledged collateral is based on the actual value, namely the market value for financial instruments listed in a regulated market, or, otherwise, the estimated realisable value. The resulting value is multiplied by the haircut percentage rates, differentiated according to the financial instruments accepted as collateral.

For real-estate collateral, the prudential market value is considered; for properties under construction, the construction cost is considered, net of prudential haircuts according to the intended use of the property. Assets are appraised by internal and external experts. The external experts are included in a special list of professionals accredited on the basis of an individual verification of their capabilities, professionalism and experience. The valuation of residential properties used as collateral for mortgage loans to private individuals is mainly assigned to specialised companies. The work of the experts is monitored on an ongoing basis, by means of statistical verifications and spot checks carried out centrally.

The experts are required to produce estimates on the basis of standardised expert reports, differentiated according to the valuation method to be applied and the characteristics of the asset, in accordance with the Property Valuation Code prepared by the Bank. The content of the internal Code is consistent with the "Guidelines for the valuation of properties securing credit exposures" promoted by the Italian Banking Association.

Property valuations are managed through a specific integrated platform covering the entire expert analysis phase, ensuring that assignments are properly awarded, on an independent basis and according to objective criteria, the workflow is thoroughly monitored, valuation standards are correctly applied and all information and documents regarding real estate are kept.

The market value of collateral property is recalculated periodically through various statistical valuation methods, which apply prices/ratios provided by an external supplier offering proven skills and a solid reputation for surveying and measuring the market prices of Italian real-estate assets.

Asset value is constantly monitored. The experts carry out inspections and verify the work progress for properties under construction. The valuation is updated in the event of limitation or splitting of the mortgage, of damage to the property, significant impairment losses reported by market indicators used to monitor fair value and, in any case, every three years for major exposures.

In order to limit the risks of absence or termination of the protection, specific safeguards are in place, including: restoration of a pledge when the assets decrease below their initial value or, for mortgages, an obligation to carry insurance cover against fire damage and the presence of adequate monitoring of the

property's value.

Guarantees are subject to accurate, regular control using a specific application, the CRM verifier, in which a series of tests have been implemented to confirm the effective compliance with the requirements set by prudential supervision regulations.

The support application verifies whether the guarantees received are eligible with reference to each of the three methods permitted by the regulations for calculating capital requirements. Based on the specifics of each category, the eligibility results are defined at the level of individual guarantee for unfunded guarantees (usually personal guarantees) or, for collateral, for each asset or financial instrument.

To mitigate the counterparty risk associated with OTC (i.e., unregulated) derivatives and SFTs (securities financing transactions, i.e. securities lending and repurchase agreements), the Group uses bilateral netting agreements that allow for credit and debt positions to be netted against one another if a counterparty defaults.

This is achieved by entering into ISDA and ISMA/PSA agreements, which also reduce the absorption of regulatory capital in accordance with supervisory provisions.

The Group also establishes collateral agreements, typically calling for daily margins, to cover transactions in OTC derivatives and SFTs (respectively the Credit Support Annex and Global Market Repurchase Agreement).

With regard to substitution risk, to mitigate risk exposure to specific counterparties, the Bank acquires protection through single name Credit Default Swaps. Furthermore, the Bank also purchases single name CDS or CDS on indexes to mitigate the risk of adjustment of the valuation of the credit or CVA.

A project was started for International Subsidiary Banks with the aim of guaranteeing a consistent approach at Group level to the use of the credit risk mitigation techniques. In further detail, the gap analysis of seven International Subsidiary Banks was completed for the main types of guarantees. For five of these, an action plan was drawn up and is now being implemented.

In 2015 the Parent Company continued its activities relating to the "GARC" (Active Credit Risk Management) project, involving a platform for monitoring credit risk in performing portfolios. The initiative involved the systematic acquisition of guarantees (both personal guarantees and collateral) to support lending of SMEs, a segment which, as a result of the crisis, was hit by significant difficulties in access to credit.

This type of transactions provide synthetic hedging of default risk (past-due, unlikely to pay and doubtful) of granular portfolios and freeing up of economic and regulatory capital, as envisaged by the current Supervisory Regulations on the matter (EU Regulation 575/2013 and Bank of Italy Circular 285/2013).

As part of these operations, during the year the junior risk relating to a total portfolio of 1.1 billion euro in loans to approximately 2,500 businesses in the Corporate and SME Corporate segments, valued by applying internal models (Advanced IRB), was sold to a specialised investor.

Performing loans

Collective measurement is compulsory for all loans for which there is no objective evidence of impairment. Such loans must be measured collectively in homogeneous portfolios, i.e. with similar characteristics in terms of credit risk.

The concept of "loss" to which to refer when measuring impairment is that of incurred loss, as opposed to expected or future losses. In the case of collective measurement, this means that reference should be made to the losses already included in the portfolio, although these cannot be identified with reference to specific loans, also defined as "incurred but not reported losses".

In any event, as soon as new information allows the loss to be assessed at the individual level, the financial asset must be excluded from collective measurement and subject to individual measurement.

Although international accounting standards do not explicitly refer to the methods developed in the context of supervisory regulations, the definition of the elements to which to refer when classifying loans into groups to be subject to collective measurement has many points of contact with the Basel 3 regulations and the possible synergies are therefore evident. Through exploitation of such synergies, a measurement model has been structured involving the use of risk parameters (Probability of Default and Loss Given Default) essentially similar to those of Basel 3.

Therefore, in accordance with regulatory provisions, the method calls for expected loss (EL) to be determined according to the risk parameters estimated for the AIRB models under banking supervision regulations.

Expected loss calculated for the purposes of the collective loan measurement procedure differs from that calculated for reporting purposes inasmuch as the LGD used in incurred loss does not (in accordance with international accounting standards) include indirect recovery costs and calibration on the negative phase of the cycle ("LGD downturn").

For loans to customers only, the expected loss (EL) is transformed into incurred loss (IL) by applying factors that capture the loss confirmation period (LCP) and economic cycle of the portfolio:

- the LCP is a factor that represents the time interval between the event that gives rise to the default
 and the occurrence of the sign of default, which allows the loss to be transformed from expected to
 incurred;
- the cyclical coefficient is an annually updated coefficient estimated on the basis of the economic cycle, made necessary by the fact that ratings, which are calibrated according to the long-term expected average level throughout the economic cycle, only partially reflect current conditions. This coefficient is determined by regulatory segment and is equal to the ratio of the default rates estimated for the following 12 months on the basis of the scenario available in the fourth quarter (used in ICAAP) to the portfolio's actual PD as measured at year-end.

The above parameters were revised in 2015 and subsequently submitted to the Chief Risk Officer for approval, so as to also account for the new mitigating factors for the risk level of performing loans in light of the aforementioned development of systems for intercepting and identifying trigger events and monitoring exposures subject to renegotiation following the entry into force of the provisions concerning forborne exposures.

The illustrated measurement method has also been extended to guarantees and commitments. In the case of the latter, the unused margins on revocable lines of credit are not included in the basis of calculation. The method and assumptions used are subject to periodic revision.

In the case of expected loss, the basic parameters (rating and LGD) are subject to verification by the validation and audit functions.

MARKET RISKS

MARKET RISKS/TRADING BOOK

Risk management strategies and processes

The allocation of capital for trading activities is set by the Parent Company's Management Bodies, through the attribution of operating limits in terms of VaR to the various Group units. The allocation of these limits is mainly aimed at Intesa Sanpaolo and Banca IMI as they represent the main portion of the Group's market risks. Some of the other Group subsidiaries hold smaller trading portfolios with a marginal risk. The Group Financial Risks Committee monitors the risks of all the Group companies on a monthly basis,

with particular reference to the absorption of the VaR limits, and recommends any corrective actions. The situation is also regularly examined by the Group Risk Governance Committee in order to propose any changes to the strategies for trading activities to the Management Bodies.

Structure and organisation of the associated risk management function

The Chief Risk Officer is responsible, at Group level, for setting out the system of operating limits, the capital allocation system, and the system of binding policies and procedures. These activities are coordinated by the Group Financial Risks Committee, which discusses the guidelines for the management of market risks.

As part of its functions, the Financial and Market Risks Department is responsible for the:

- calculation, development and definition of the risk indicators: Value at Risk, sensitivity and greeks, level measures, stress tests and scenario analyses;
- monitoring of operating limits;
- establishment of the parameters and rules for the valuation of assets subject to mark-to-market and fair value at Group level, as well as their direct valuation when this cannot be obtained from instruments available to the business units;
- comparison of the P&L with the risk indicators and in particular with the VaR (so-called backtesting).

The structure of the Financial and Market Risks Department is based on the following guidelines:

- structuring of the responsibilities according to the main risk taking centres and to "Risk Type";
- focusing and specialisation of the resources on the "Risk Owners";
- compliance with the instructions and proposals of the Supervisory Authorities;

- sustainability of the operating processes, including:
 - o the methodological development;
 - o the collection, processing and production of data;
 - o the maintenance and refinement of the instruments and application models;
 - o the general consistency of the data produced.

Scope of application and characteristics of the risk measurement and reporting system

The quantification of trading risks is based on daily and periodic VaR of the trading portfolios of Intesa Sanpaolo and Banca IMI, which represent the main portion of the Group's market risks, to adverse market movements of the following risk factors:

- interest rates;
- equities and market indexes;
- investment funds;
- foreign exchange rates;
- implied volatilities;
- spreads in credit default swaps (CDSs);
- spreads in bond issues;
- correlation instruments;
- dividend derivatives:
- asset-backed securities (ABSs);
- commodities.

The risk indicators used may be divided into six main types:

- Value at Risk (VaR), which represents the backbone of the whole risk management system due to its characteristics of uniformity, consistency and transparency in relation to both economic capital and the Group Finance operations;
- sensitivity and greeks, which are the essential accompaniment to the VaR indicators due to their ability to capture the sensitivity and the direction of the existing financial trading positions in relation to the various individual risk factors;
- level measures (such as notional and Mark to Market), which are a useful aid to the above indicators as an immediately applicable solution;
- stress tests and scenario analyses that enable the completion of the analysis of the overall risk profile, capturing changes in predetermined assumptions relating to the evolution of the underlying risk factors, also simulating anomalous market conditions (opening of the basis risks, worst case);
- Incremental Risk Charge (IRC), an additional measure to VaR that enables the correct representation
 of the specific risk on debt securities and credit derivatives because it also captures event and default
 risk, in addition to idiosyncratic risk.
- Stressed VaR (from 31 December 2011 it contributes to the determination of capital absorption), which represents the VaR associated with a market stress period, identified on the basis of the indications presented in the Basel document "Revision to the Basel II market risk framework".

The reporting system is continuously updated in order to take into account the evolution of the operations, the organisational structures and the analytical methods and tools available.

Policies for hedging and mitigating risk

In Intesa Sanpaolo and Banca IMI, weekly risk meetings are held during which the main risk factors of the portfolios are discussed. The monitoring and discussions take place on the basis of a series of reports by the Financial and Market Risks Department based on standard quantitative indicators (VaR, greeks, and issuer risk) and stress indicators (what if analysis, stress tests on particular macroeconomic scenarios/risk factors, and marginal VaR).

This set of information represents an effective means for deciding policies for the hedging and mitigating of risk, as it enables the provision of detailed recommendations to the trading rooms on the risk profile of the books, and the identification of any idiosyncratic risks and concentrations, and the suggestion of methods for the hedging of exposures considered to be a potential source of future deteriorations in the value of the portfolios.

During the weekly meetings the Financial and Market Risks Department ensures the consistency of the positions with the decisions taken in the Group Financial Risks Committee.

Strategies and processes for the ongoing assessment of their effectiveness

At operational level, in addition to the daily reporting (VaR, sensitivities, level measures, control of assigned limits), information is exchanged between the heads of the Business Departments during the abovementioned Risk Meetings called by the heads of the Departments.

More specifically, during the Risk Meetings the risk profile is examined in detail, with the aim of ensuring that operations are conducted in an environment of controlled risk, and the appropriate use of the capital available.

MARKET RISKS/BANKING BOOK

Risk management strategies and processes

Market risk originated by the banking book arises primarily in the Parent Company and in the main other subsidiaries that carry out retail and corporate banking.

Specifically, in managing interest rate risk in the banking book, the Intesa Sanpaolo Group seeks to maximise profitability, by adopting operating methods consistent with the general stability of the financial results over the long term. To this end, positions are adopted that are consistent with the strategic views produced during the regular meetings of the Group Financial Risks Committee, which is also responsible for the assessment of the overall risk profile of the Group and its main operational units.

The "structural" foreign exchange risk refers to the exposures deriving from the commercial operations and strategic investment decisions of the Intesa Sanpaolo Group. The main sources of foreign exchange risk consist of foreign currency loans and deposits held by corporate and retail customers, purchases of securities, equity investments and other financial instruments in foreign currencies, and conversion into domestic currency of assets, liabilities and income of branches and banking subsidiaries abroad.

The banking book also includes the exposure to the price risk deriving from the equity investments in companies not consolidated on a line-by-line basis and to the foreign exchange risk represented by equity investments in foreign currency, including Group companies.

Structure and organisation of the associated risk management function

Within the Financial and Market Risks Department, the market risks of the Banking Book and the Liquidity risk (discussed below) are overseen by the Banking Book Financial Risks Unit, which is responsible for:

- setting out the criteria and methods for the measurement and management of the financial risks of the banking book (interest rate, foreign exchange, minority equity investments and liquidity);
- proposing the system of operational limits and the guidelines for the management of financial risks for the operational units of the Group involving the operations of the banking book;
- measuring the financial risks of the banking book assumed by the Parent Company and the other Group Companies, both directly, through specific outsourcing contracts, and indirectly by consolidating the information originating from the local control units, and verifying compliance by the Group Companies with the limits set by the Statutory Bodies, reporting on their progress to Top Management and the Parent Company's operational structures;
- analysing the overall financial risk profile of the Group's banking book, proposing any corrective measures, within the more general context of the guidelines set out at strategic planning level or by the Corporate Bodies;
- managing the assessment and measurement, for the Parent Company and all the other Group Companies governed by outsourcing contracts, of the effectiveness of the hedging relationships (hedge accounting) required by the IAS/IFRS regulations (for the main Group companies the structures of the Parent Company centralise these activities in order to achieve operational efficiencies and the most effective governance of the process. For the other subsidiaries, it provides direction and guidance);
- supporting the AVM and Strategies Unit in relation to strategic ALM.

Scope of application and characteristics of the risk measurement and reporting system

The financial risks generated by the banking book are measured monthly, using two types of measurement, namely Value at Risk (VaR) and Sensitivity analysis.

Value at Risk corresponds to the maximum loss that the book can incur in the following ten business days in 99% of cases, on the basis of the volatilities and the historical correlations (of the last 250 business days) between the individual risk factors, consisting, for each foreign currency, of the reference curves,

the exchange rates and the prices of the equities⁸.

Shift sensitivity analysis quantifies the change in value of a financial portfolio resulting from adverse movements in the main risk factors (interest rate, foreign exchange, and equity).

The measurements include an estimate of the prepayment effect and of the risk originated by on demand customer deposits, whose features of stability and of partial and delayed reaction to interest rate fluctuations have been studied by analysing a large collection of historical data, obtaining a maturity representation model through equivalent deposits.

Furthermore, sensitivity of the interest margin is measured by quantifying the impact on net interest income of a parallel and instantaneous shock in the interest rate curve, over a period of 12 months.

Policies for hedging and mitigating risk

Hedging of interest rate risk is aimed (i) at protecting the banking book from variations in the fair value of loans and deposits due to movements in the interest rate curve, or (ii) at reducing the volatility of future cash flows related to a particular asset/liability.

The main types of derivative contracts used are interest rate swaps (IRS), overnight index swaps (OIS), cross-currency swaps (CCS) and options on interest rates stipulated with third parties or with other Group companies. The latter, in turn, cover risk in the market so that the hedging transactions meet the criteria to qualify as IAS-compliant for consolidated financial statements.

Hedging activities performed by the Intesa Sanpaolo Group are recorded using various hedge accounting methods. A first method refers to the fair value hedge of specifically identified assets and liabilities (microhedging), mainly consisting of bonds issued or acquired by Group companies and loans to customers. On the basis of the carved-out version of IAS 39, fair-value hedging is also applied for the macrohedging of the stable portion of on demand deposits (core deposits) and on the already fixed portion of variable-rate loans.

In 2015 the Group extended the use of macrohedging to a portion of fixed-rate loans, adopting an open-portfolio macrohedging model for a portion of fixed-rate loans according to a bottom-layer approach that, in accordance with the interest rate risk measurement method involving modelling of the prepayment phenomenon, is more closely correlated with risk management activity and asset dynamics.

Another hedging method used is the cash flow hedge, which has the purpose of stabilising interest flow on both variable rate funding, to the extent that the latter finances fixed-rate investments, and on variable rate investments to cover fixed-rate funding (macro cash flow hedges).

The Financial and Market Risks Department is in charge of measuring the effectiveness of interest rate risk hedges for the purpose of hedge accounting, in compliance with international accounting standards.

Foreign exchange risk deriving from operating positions in foreign currency in the banking book is systematically transferred from the business units to the Parent Company's Treasury Department, for the purpose of guaranteeing the elimination of such risk. Similar risk containment is performed by the various Group companies for their banking book. Essentially, foreign exchange risk is mitigated by the practice of raising funds in the same currency as assets.

For equity investments in Group companies held in foreign currencies, risk hedging policies are assessed by the Group Risk Governance Committee and the Group Financial Risks Committee, taking into consideration the advantages and the costs embedded in hedging transactions.

LIQUIDITY RISK

Liquidity risk is defined as the risk that the Bank may not be able to meet its payment obligations due to the inability to procure funds on the market (funding liquidity risk) or liquidate its assets (market liquidity risk).

The arrangement of a suitable control and management system for that specific risk has a fundamental role in maintaining stability, not only at the level of each individual bank, but also of the market as a whole, given that imbalances within a single financial institution may have systemic repercussions. Such a system must be integrated into the overall risk management system and provide for incisive controls consistent with developments in the context of reference.

The provisions on liquidity - introduced in the European Union in June 2013 with the publication of Regulation (EU) 575/2013 and Directive 2013/36/EU - were updated in early 2015 with the publication in

⁸Value at Risk calculation models have certain limitations, as they are based on the statistical assumption of the normal distribution of the returns and on the observation of historical data that may not be repeated in the future. Consequently, VaR results cannot guarantee that the possible future losses will not exceed the statistically calculated estimates.

the Official Journal of the European Union of Commission Delegated Regulation (EU) 61/2015 with regard to liquidity coverage requirements (liquidity coverage ratio - LCR), supplementing and partially amending previous regulations. Under Delegated Regulation 61/2015, from 1 October 2015 banks are required to comply with the new short-term indicator according to the phase-in process provided for in Art. 38 (60% from 1 October 2015, 70% from 1 January 2016, 80% from 1 January 2017 and 100% from 1 January 2018).

The Guidelines for Group Liquidity Risk Management, which already referred to Bank of Italy Circulars 263 and 285, and to Directive 2013/36/EU (CRD IV) and Regulation (EU) 575/2013 (CRR), were therefore updated with effect from March 2015 to reflect the above additional regulations, which revised the composition of the liquid assets eligible for liquidity reserves and the definition of 30-day liquidity flows valid for the calculation of the LCR. With respect to structural liquidity, the most recent regulatory provisions of the Basel Committee concerning the Net Stable Funding Ratio (NSFR) with its October 2014 publication were also adopted.

The "Guidelines for Group Liquidity Risk Management" approved by Intesa Sanpaolo's corporate bodies illustrate the tasks of the various corporate functions, the rules and the set of control and management processes aimed at ensuring prudent monitoring of liquidity risk, thereby preventing the emergence of crisis situations. With reference to the Fund Transfer Pricing System, the Transfer Rates Implementing Rules were updated in June 2015 together with the introduction of some new developments mainly concerning the determination of behavioural Transfer Rates Implementing Rules.

The key principles underpinning the Liquidity Policy of the Intesa Sanpaolo Group are:

- the existence of liquidity management guidelines approved by senior management and clearly disseminated throughout the bank;
- the existence of an operating structure that works within set limits and of a control structure that is independent from the operating structure;
- the constant availability of adequate liquidity reserves in relation to the pre-determined liquidity risk tolerance threshold;
- the assessment of the impact of various scenarios, including stress testing scenarios, on the cash inflows and outflows over time and the quantitative and qualitative adequacy of liquidity reserves;
- the adoption of an internal fund transfer pricing system that accurately incorporates the cost/benefit
 of liquidity, on the basis of the Intesa Sanpaolo Group's funding conditions.

With regard to liquidity risk measurement metrics and mitigation tools, in addition to defining the methodological system for measuring short-term and structural liquidity indicators, the Group also formalises the maximum tolerance threshold (risk appetite) for liquidity risk, the criteria for defining liquidity reserves and the rules and parameters for conducting stress tests.

From an organisational standpoint, a detailed definition is prepared of the tasks assigned to the strategic and management supervision bodies and reports are presented to the senior management concerning certain important formalities such as the approval of measurement methods, the definition of the main assumptions underlying stress scenarios and the composition of early warning indicators used to activate emergency plans.

In order to pursue an integrated, consistent risk management policy, strategic decisions regarding liquidity risk monitoring and management at the Group level fall to the Parent Company's corporate bodies. From this standpoint, the Parent Company performs its functions of monitoring and managing liquidity not only in reference to its own organisation, but also by assessing the Group's overall transactions and the liquidity risk to which it is exposed.

The departments of the Parent Company that are in charge of ensuring the correct application of the Guidelines are, in particular, the Treasury Department, the Planning Department and the Active Value Management Department, responsible for liquidity management, and the Financial and Market Risks Department, directly responsible for measuring liquidity risk on a consolidated basis.

The aforementioned Guidelines include procedures for identifying risk factors, measuring risk exposure and verifying observance of limits, conducting stress tests, identifying appropriate risk mitigation initiatives, drawing up emergency plans and submitting informational reports to company bodies. Within this framework, liquidity risk measurement metrics are laid down, distinguishing between short-term liquidity, structural liquidity and stress tests.

The short-term Liquidity Policy is aimed at ensuring an adequate, balanced level of cash inflows and outflows with certain or estimated maturities included in 12 months' time horizon, in order to face periods of tension, including extended ones, on different funding markets, also by establishing adequate liquidity reserves in the form of assets eligible for refinancing with Central Banks or liquid securities on private markets. To that end, and in keeping with the liquidity risk appetite, the system of limits consists of two short-term indicators for holding periods of one week (cumulative projected imbalance in wholesale operations) and of one month (Liquidity Coverage Ratio - LCR).

The cumulative projected wholesale imbalances indicator measures the Bank's independence from unsecured wholesale funding in the event of a freeze of the money market and aims to ensure financial autonomy, assuming the use on the market of only the highest quality liquidity reserves. The LCR indicator is aimed at strengthening the short-term liquidity risk profile, ensuring that sufficient unencumbered high quality liquid assets (HQLA) are retained that can be converted easily and immediately into cash on the private markets to satisfy the short-term liquidity requirements (30 days) in a liquidity stress scenario. To this end, the Liquidity Coverage Ratio measures the ratio between: (i) the stock of HQLA and (ii) the total net cash outflows calculated according to the scenario parameters defined by the Regulations.

The aim of Intesa Sanpaolo Group's structural Liquidity Policy is to adopt the structural requirement provided for by the regulatory provisions of Basel 3: Net Stable Funding Ratio (NSFR). This indicator is aimed at promoting the increased use of stable funding, to prevent medium/long-term operations from giving rise to excessive imbalances to be financed in the short term. To this end, it sets a minimum "acceptable" amount of funding exceeding one year in relation to the needs originating from the characteristics of liquidity and residual duration of assets and off-balance sheet exposures. NSFR's regulatory requirement, which is still subject to a period of observation, will come into force starting from 1 January 2018.

Within the Liquidity Policy it is also envisaged the time extension of the stress scenario for LCR indicator, provided by the new regulatory framework, measuring, for up to 3 months, the effect of specific acute liquidity tensions (at bank level) combined with a widespread and general market crisis. The internal management guidelines also envisage an alert threshold (Stressed soft ratio) for the LCR indicator up to 3 months, with the purpose of establishing an overall level of reserves covering greater cash outflows during a period of time that is adequate to implement the required operating measures to restore the Group to balanced conditions.

The Guidelines also establish methods for management of a potential liquidity crisis, defined as a situation of difficulty or inability of the Bank to meet its cash obligations falling due, without implementing procedures and/or employing instruments that, due to their intensity or manner of use, do not qualify as ordinary administration.

By setting itself the objectives of safeguarding the Group's asset value and also guaranteeing the continuity of operations under conditions of extreme liquidity emergency, the Contingency Liquidity Plan ensures the identification of the early warning signals and their ongoing monitoring, the definition of procedures to be implemented in situations of liquidity stress, the immediate lines of action, and the intervention measures for the resolution of emergencies. The early warning indexes, aimed at spotting the signs of a potential liquidity strain, both systematic and specific, are monitored with daily frequency by the Financial and Market Risks Department.

In 2015 the Group's sound liquidity position - supported by suitable high quality liquid assets (HQLA) and the significant contribution from retail stable funding - remained within the risk limits set out in the current Group Liquidity Policy: both indicators (LCR and NSFR) were met, already reaching a level above the limits under normal conditions. Also the stress tests, when considering the consistent liquidity reserves (liquid or eligible), yielded results in excess of the target threshold for the Intesa Sanpaolo Group, with a liquidity surplus capable of meeting extraordinary cash outflows for a period of more than 3 months.

Adequate and timely information regarding the development of market conditions and the position of the Bank and/or Group was provided to company bodies and internal committees in order to ensure full awareness and manageability of the main risk factors.

OPERATIONAL RISK

Operational risk management strategies and processes

The control of the Group's operational risk was attributed to the Management Board, which identifies risk management policies, and to the Supervisory Board, which is in charge of their approval and verification, as well as of the guarantee of the functionality, efficiency and effectiveness of the risk management and control system.

Moreover, the tasks of the Intesa Sanpaolo Group Internal Control Coordination and Operational Risk Committee include periodically reviewing the overall operational risk profile, authorising any corrective measures, coordinating and monitoring the effectiveness of the main mitigation activities and approving operational risk transfer strategies.

Organisational structure of the associated risk management function

The Group has a centralised function within the Group Risk Manager Area (specifically in the Enterprise Risk Management Department) for the management of the Group's operational risk. This function is responsible for the definition, implementation, and monitoring of the methodological and organisational framework, as well as for the measurement of the risk profile, the verification of mitigation effectiveness and reporting to Top Management.

In compliance with the prevailing regulations, the individual Organisational Units are responsible for the identification, assessment, management and mitigation of risk. Specific functions have been identified within these Organisational Units responsible for the Operational Risk Management processes of their unit (collection and structured census of information relating to operational events, scenario analyses and assessment of the level of risk associated with the business environment).

Scope of application and characteristics of the risk measurement and reporting system

As from 31 December 2009, the Group has adopted the Advanced Measurement Approach (AMA - internal model), in partial use with the standardised (TSA) and basic approaches (BIA) to determine the capital requirement for regulatory purposes. The AMA approach was adopted by the main banks and companies in the Banca dei Territori, Corporate and Investment Banking, Private Banking and Asset Management Divisions, by the Intesa Sanpaolo Group Services consortium and by VUB Banka (including Consumer Financial Holding and VUB Leasing) and PBZ Banka.

The Integrated self-diagnosis process, conducted on an annual basis, allows the Group to:

- identify, measure, monitor and mitigate operational risk through identification of the main operational problem issues and definition of the most appropriate mitigation actions;
- create significant synergies with the other functions with control duties of the Personnel and Organisation Department that supervise the planning of operational processes and business continuity issues, with the Administrative and Financial Governance and with control functions (Compliance and Internal Auditing) that supervise specific regulations and issues (Legislative Decree 231/01, Law 262/05) or conduct tests of the effectiveness of controls of company processes.

The Self-diagnosis process identified a good overall level of control of operational risks and contributed to enhancing the diffusion of a business culture focused on the ongoing control of these risks.

The process of collecting data on operational events (in particular operational losses, obtained from both internal and external sources) provides significant information on the exposure. It also contributes to building knowledge and understanding of the exposure to operational risk, on the one hand, and assessing the effectiveness or potential weaknesses of the internal control system, on the other hand.

Operational risks are monitored by an integrated reporting system, which provides management with support information for the management and/or mitigation of the operational risk.

In order to support the operational risk management process on a continuous basis, a structured training programme was implemented for employees actively involved in this process.

Policies for hedging and mitigating risk

The Group activated a traditional operational risk transfer policy (to protect against offences such as employee disloyalty, theft and theft damage, cash and valuables in transit losses, computer fraud, forgery, cyber, earthquake and fire, and third-party liability), which contributes to mitigating exposure to operational risk. At the end of June 2013, in order to allow optimum use of the available operational risk transfer tools and to take advantage of the capital benefits, pursuant to applicable regulations the Group stipulated an insurance coverage policy named Operational Risk Insurance Programme, which offers

additional coverage to traditional policies, significantly increasing the limit of liability, transferring the risk of significant operational losses to the insurance market.

The internal model's insurance mitigation component was approved by the Bank of Italy in June 2013 with immediate effect of its benefits on operations and on the capital requirements.

OTHER RISKS

In addition to the risks discussed above, the following other risks have been identified and monitored by the Group.

Strategic risk

The Intesa Sanpaolo Group defines current or prospective strategic risk as risk associated with a potential decline in profits or capital due to changes in the operating context, misguided Company decisions, inadequate implementation of decisions, or an inability to react sufficiently to changes in the competitive scenario.

The Group's response to strategic risk is represented first and foremost by policies and procedures that call for the most important decisions to be deferred to the Management Board and the Supervisory Board, supported by a current and forward-looking assessment of risks and capital adequacy. The high degree to which strategic decisions are made at the central level, with the involvement of the top corporate governance bodies and the support of various company functions ensures that strategic risk is mitigated. An analysis of the definition of strategic risk leads to the observation that this risk is associated with two distinct fundamental components:

- a component associated with the possible impact of misguided Company decisions and an inability to react sufficiently to changes in the competitive scenario: this component does not require capital, but is one of the risks mitigated by the ways in which strategic decisions are reached and by their centralisation with top management, where all significant decisions are always supported by specific activities aimed at identifying and measuring the risks implicit in the initiative;
- the second component is more directly related to business risk; in other words, it is associated with the risk of a potential decline in profits as a result of the inadequate implementation of decisions and changes in the operating context. This component is handled not only by using systems for regulating Company management, but also via specific internal capital, determined according to the Variable Margin Volatility (VMV) approach, which expresses the risk arising from the business mix of the Group and its Business Units.

Strategic risk is also assessed as part of stress tests based on a multiple-factor model that describes the relations between changes in the economic scenario and the business mix resulting from planning hypotheses, with analysis to assess the impacts on both interest income and margins from the performance of net fees and commissions.

Reputation risk

The Intesa Sanpaolo Group attaches great importance to reputational risk, namely the current and prospective risk of a decrease in profits or capital due to a negative perception of the Bank's image by customers, counterparties, shareholders, investors and Supervisory Authorities.

The Group actively manages its image in the eyes of all stakeholders and aims to prevent and contain any negative effects on its image, including through robust, sustainable growth capable of creating value for all stakeholders, while also minimising possible adverse events through rigorous, stringent governance, control and guidance of the activity performed at the various service and function levels.

The reputational risk governance model of Intesa Sanpaolo envisages that management and mitigation of reputational risks is pursued:

- systematically and independently by the corporate structures with specific tasks aimed at preserving corporate reputation, through a structured system of organisational monitoring measures;
- across the various corporate functions, through the Reputational Risk Management process governed by specific Guidelines.

The 'systematic monitoring of reputational risk envisages:

- specific organisational structures which, each for its purview, monitor the Bank's reputation and manage the relationships with the various stakeholders;
- an integrated monitoring system for primary risks, to limit exposure to them;
- compliance with standards of ethics and conduct;

 establishing and managing customers' risk appetite, through the identification of their various risk tolerance profiles according to subjective and objective traits of each customer.

A fundamental tool for reputational risk monitoring is the Code of Ethics adopted by the Group. This contains the basic values to which it intends to commit itself and enunciates the voluntary principles of conduct for dealings with all stakeholders (customers, employees, suppliers, shareholders, the environment and, more generally, the community) with broader objectives than those required by mere compliance with the law. The Group has also issued voluntary conduct policies (environmental policy and arms industry policy) and adopted international principles (UN Global Compact, UNEP FI, Equator Principles) aimed at pursuing respect for the environment and human rights.

In order to safeguard customers' interests and the Group's reputation, specific attention is also devoted to establishing and managing customers' risk tolerance, through the identification of their various risk appetite profiles according to subjective and objective traits of each customer. The assessments of adequacy during the process of structuring produces and rendering advisory services are supported by objective assessments that contemplate the true nature of the risks borne by customers when they undertake derivative transactions or make financial investments.

More specifically, the marketing of financial products is also governed by specific advance risk assessment from the standpoint of both the Bank (along with risks, such as credit, financial and operational risks, that directly affect the owner) and the customer (portfolio risk, complexity and frequency of transactions, concentration on issuers or on foreign currency, consistency with objectives and risk tolerance profiles, and knowledge and awareness of the products and services offered).

The Group aims to achieve constant improvement of reputational risk governance also through an integrated compliance risk management system, as it considers compliance with the regulations and fairness in business to be fundamental to the conduct of banking operations, which by nature is founded on trust.

The "cross-function" monitoring of reputational risk is entrusted to the Reputational Risk Management (RRM) process, conducted yearly and aimed at integrating and consolidating the main findings provided by the organisational structures more directly involved in monitoring the company's reputation. The objective of that process is to identify and mitigate the most significant reputational risk scenarios to which the Intesa Sanpaolo Group is exposed through:

- the identification of the main risk scenarios to which the Group is exposed, by the Enterprise Risk Management Department, along with the Governance and Controls Compliance Department as regards the compliance risks and with the cooperation of the other relevant corporate functions;
- the assessment of said scenarios by the Top Management;
- the definition and monitoring of adequate communication strategies and specific mitigation measures.

The Intesa Sanpaolo Group carefully considers all the risks associated with climate change that may result in additional costs for the Bank or its customers. Specifically, with regard to changes in national and international regulations which could have significant financial effects on its customers, through the subsidiary Mediocredito Italiano, Intesa Sanpaolo has set up an Energy Desk specialising in supporting customer companies in energy efficiency projects and advanced advisory services on legal developments and how to suitably prepare for compliance with such regulations.

Furthermore, with regard to the risk of extreme weather events or emergencies due to climate changes, to meet the needs of customers that have incurred damages, following such events Intesa Sanpaolo shall suspend payment of mortgage loans and instalments of loans for retail customers and businesses in areas seriously impacted by weather events.

Risk on owned real-estate assets

The risk on owned real-estate assets may be defined as risk associated with the possibility of suffering financial losses due to an unfavourable change in the value of such assets and is thus included in the category of banking book financial risks. Real estate management is highly centralised and represents an investment that is largely intended for use in company operations. The degree of risk in the portfolio of owned properties is represented by using a VaR-type model based on indexes of mainly Italian real estate prices, which is the main type of exposure associated with the Group's real-estate portfolio.

Insurance risk

The Intesa Sanpaolo Group operates as a financial conglomerate that engages in universal banking activity and insurance services. With regard to insurance it operates in both the life business, primarily, and in the non-life business.

The Intesa Sanpaolo Group defines insurance risk as the risk connected with the possibility of suffering economic losses on the value of the insurance assets (net of liabilities), deriving from an unfavourable variation of the market, technical and operating risk factors.

These risks are incorporated in the measurement of economic capital, used to assess capital adequacy (see Section on Capital requirements).

As also mentioned in the Introduction to this Disclosure, the insurance risk is not analysed specifically in this document. This risk is discussed in detail in the Group's consolidated financial statements in Part E- Section 2-Risks of insurance companies.

Section 2 – Scope of application

Qualitative disclosure

Name of the bank to which the disclosure requirement applies

Intesa Sanpaolo S.p.A. Parent Company of the Intesa Sanpaolo Banking Group, included in the National Register of Banking Groups.

Outline of differences in the basis of consolidation for accounting and prudential purposes

The disclosure contained in this document refers solely to the Intesa Sanpaolo Banking Group as defined by the prevailing Supervisory Provisions.

The consolidation area of the Banking Group (or the "prudential" scope of consolidation) differs from the scope of consolidation of the financial statements (the complete list of consolidated companies is included in Part A of the Notes to the consolidated financial statements), which includes Intesa Sanpaolo and the companies that it directly and indirectly controls. The scope of consolidation - as specified by IAS/IFRS - also includes the companies operating in dissimilar sectors from the Parent Company, as well as private equity investments. Similarly, special purpose entities/vehicles (SPE/SPV) are included when the requisite of effective control recurs, even if there is no stake in the company.

The "prudential" consolidation area, on the other hand, excludes from line-by-line consolidation the companies carrying out insurance, commercial or other types of business other than banking and finance activities and some types of special purpose vehicles. Moreover, for the purposes of prudential consolidation, the companies that are jointly controlled by Intesa Sanpaolo, which are measured using the equity method in the financial statements, are consolidated using the proportional method.

With respect to the scope of consolidation of the financial statements, therefore, for the purpose of defining the prudential consolidation area, the following companies are treated with different consolidation methods:

- Companies subject to joint control consolidated with the proportional method (carried at equity in the financial statements):
 - ➤ MIR Capital S.C.A. SICAR
 - Allfunds Bank
 - Pbz Croatia Osiguranje Public Limited Company For Compulsory Pension Fund Management
 - VUB Generali Dochodkova Spravcovska¹.
- Company carried at equity (consolidated line-by-line in the financial statements):
 - Companies that are not part of the Banking Group, since they are engaged in insurance activities
 - Intesa Sanpaolo Vita¹
 - Intesa Sanpaolo Life¹
 - Intesa Sanpaolo Assicura¹
 - Fideuram Vita
 - o Companies that are not part of the Banking Group, since they are engaged in commercial activities or other types of business other than banking and financial activities:
 - TT1 Lux
 - ➤ In.Fra (Investire nelle Infrastrutture)
 - > C.I.F. (Compagnia Italiana Finanziaria)
 - I.L. (Iniziative Logistiche)
 - Cib Car Trading
 - > Cib Insurance Broker
 - Recovery Property Utilisation and Service
 - Brivon Hungary

¹ A direct subsidiary of the Banking Group, deducted from own funds for the amount exceeding the thresholds envisaged in the regulations.

- Telco IS S.r.l.
- Manzoni S.r.l.²
- > Risanamento Group²
- Vehicle companies (SPE/SPV)
 - Duomo Funding
 - Lunar Funding V
 - Romulus Funding
 - > Trade Receivables Investment Vehicle

Intragroup transactions concerning Companies not included in the prudential consolidation scope (since they are carried out at equity) were allocated under transactions with third parties.

Derogation to the application of liquidity requirements on an individual basis

The competent authorities may waive in full or in part the application of Part 6 of the CRR to an institution and to all or some of its subsidiaries in the Union and supervise them as a single liquidity subgroup. Under Article 8 par. 2 CRR, the application on an individual basis of the provisions of Part 6 of the CRR is waived for Italian banks belonging to a banking group. Therefore, the Parent company Intesa Sanpaolo complies with the provisions of Part 6 of the CRR on a consolidated basis and, where relevant, at the level of liquidity sub-group (See Bank of Italy Circular no. 285 of 17 December 2013 – Part II, Chapter 11, Section III).

² Company not subject to the management and coordination activities pursuant to art. 2497 and following of the Italian Civil Code.

Section 3 - Own Funds

Qualitative disclosure

Introduction

The harmonised rules for banks and investment companies contained in Directive 2013/36/EU (CRD IV) and in (EU) Regulation no. 575/2013 (CRR) of 26 June 2013, which transpose the banking supervision standards defined by the Basel Committee (the Basel 3 Framework) into European Union laws, became applicable from 1 January 2014.

These regulatory provisions were adopted in Italy through the following circulars:

- Bank of Italy Circular 285: Supervisory regulations for banks;
- Bank of Italy Circular 286: Instructions for preparing prudential reports for banks and Italian investment companies;
- Update to Bank of Italy Circular 154: Credit and financial institutions supervisory reports: Preparation and transmission.

The new regulatory framework requires that Own Funds (or regulatory capital) are made up of the following tiers of capital:

- Tier 1 capital, in turn composed of:
 - o Common Equity Tier 1 Capital (CET1);
 - Additional Tier 1 Capital (AT1);
- Tier 2 capital (T2)

Tier 1's predominant element is Common Equity, mainly composed of equity instruments (e.g. ordinary shares net of treasury shares), share premium reserves, profit reserves, valuation reserves and eligible minority interests, plus deducted elements.

In order to be eligible for Common Equity, the equity instruments issued must guarantee absorption of losses on going concern, by satisfying the following characteristics:

- maximum level of subordination;
- option for suspending the payment of dividends/coupons at the full discretion of the issuer and in a non-cumulative manner;
- unredeemability;
- absence of redemption incentives.

At present, with reference to the Intesa Sanpaolo Group, no equity instrument other than ordinary shares is eligible for inclusion in Common Equity.

A number of prudential filters are also envisaged with effects on Common Equity:

- filter on profits associated with future margins deriving from securitisations;
- filter on cash flow hedge (CFH) reserves;
- filter on profits or losses on liabilities designated at fair value (derivatives or otherwise) associated with changes in own credit rating;
- adjustments to fair value assets associated with the "prudent valuation".

The regulations also envisage a series of elements to be deducted from Common Equity Tier 1:

- goodwill, intangible assets and residual intangible assets;
- deferred tax assets (DTA) associated with future income not deriving from temporary differences (e.g. DTA on losses carried forward);
- expected losses exceeding total adjustments (the shortfall reserve) for positions weighted according to IRB approaches;
- net assets deriving from defined benefit plans;
- exposures for which it is decided to opt for deduction rather than a 1.250% weighting among RWA;
- minor investments in CET1 instruments issued by companies operating in the financial sector (less the amount exceeding the thresholds envisaged in the regulations);

- deferred tax assets (DTA) that rely on future profitability and arise from temporary differences (deducted for the amount exceeding thresholds envisaged in the regulations);
- significant investments in CET1 instruments issued by companies operating in the financial sector (less the amount exceeding the thresholds envisaged in the regulations).

In general, the AT1 category includes equity instruments other than ordinary shares (which are eligible for Common Equity) and which meet the regulatory requirements for inclusion in that level of own funds (e.g. savings shares).

Tier 2 Capital is mainly composed of eligible subordinated liabilities and any excess of adjustments over and above expected losses (the excess reserve) for positions weighted according to IRB approaches.

As previously specified, the new regulatory framework will be introduced gradually over a transitional period, generally through 2017, during which several elements that, when the framework is in full effect, will be eligible for full inclusion in or deduction from common equity, will only have a partial percent effect on Common Equity Tier 1 Capital. Generally, the residual percentage, after the applicable portion, is included in/deducted from Additional Tier 1 Capital (AT1) or Tier 2 Capital (T2), or is considered among risk-weighted assets.

Specific transitional provisions have also been established for subordinated instruments that do not meet the requirements envisaged in the new regulatory provisions, aimed at the gradual exclusion of instruments no longer regarded as eligible from own funds (over a period of eight years).

Summary information on the main terms and conditions of the features of capital items

The table below details the captions of the consolidated shareholders' equity that together with the capital components pertaining to third party shareholders contribute to the determination of the regulatory capital.

Shareholders' equity	47,776	817	48,593	44,683	379	45,062

The main features of the items listed and related to Group capital above are summarised below.

The share capital of the Bank as at 31 December 2015 amounted to 8,732 million euro, divided into 15,859,575,782 ordinary shares and 932,490,561 non-convertible savings shares, with a nominal value of 0.52 euro per share. Each ordinary share gives the right to one vote in the Shareholders' Meeting.

Savings shares, which may be in bearer form, entitle the holder to attend and vote at the Special Meeting of savings shareholders.

Savings shares must be attributed a preferred dividend up to 5% of the nominal value of the share. If in one year the dividend is less than 5% of the nominal value of the non-convertible savings shares, the difference will be added to the preferred dividend paid in the following two accounting periods. Furthermore, retained earnings made available for distribution by the Shareholders' Meeting, net of the above dividend, will be allocated to all shares so that the dividend per non-convertible savings share will be 2% of nominal value higher than for ordinary shares.

In case of distribution of reserves the savings shares have the same rights as other shares. In the case of liquidation of the Company, savings shares shall have pre-emptive rights with regard to the reimbursement of the entire nominal value of the shares.

As at 31 December 2015, Intesa Sanpaolo had 70 million euro in treasury shares.

At the date of this document, the share capital was fully paid-in and liberated.

The share premium reserve essentially includes the same balance sheet item as the Parent Company, primarily generated by the entries made in accordance with IFRS 3 for the merger between Banca Intesa and Sanpaolo IMI, as well as recognition of a portion of the capital increase completed in June 2011 as share premium.

Reserves amounted to 9,167 million euro and included legal reserve, extraordinary reserve, concentration reserves (Law 218 of 30 July 1990, art. 7, par. 3 and Law 218 of 30 July 1990, art. 7) and other reserves for a total of 3,576 million euro, as well as the consolidation reserve equal to 5,591 million euro.

The legal reserve, set up as provided for by law, must be at least one fifth of share capital; in the past it was set up by allocating each year at least one twentieth of net income for the year. Should the reserve decrease, it must be reintegrated by allocating at least one twentieth of net income for the year.

Concentration reserves ex Law 218 of 30 July 1990 were set up at the time of reorganisations or concentrations carried out pursuant to the aforementioned law.

Other reserves included reserves pertaining to branches abroad and other reserves set up in the past following specific legal provisions.

Consolidation reserves were generated following the elimination of the book value of equity investments against the corresponding portion of the shareholders' equity of each investment.

The valuation reserves amounted to negative 950 million euro and included valuation reserves of financial assets available for sale for 974 million euro, reserves of cash flow hedge derivatives for -1,138 million euro, exchange rate valuation reserves (relating to fully consolidated investments) for -766 million euro and legally-required revaluation reserves for 352 million euro, as well as the negative reserve on actuarial profits (losses) from defined benefit pension plans for -484 million euro, in addition to approximately 112 million euro in valuation reserves connected to minority equity investments.

"Equity instruments" include the first issue of Additional Tier 1 equity instruments, made during September 2015.

The breakdown of the Group and third party shareholders' equity for the Group's various operating segments is shown in the table below.

Consolidated Group and third party shareholders' equity: breakdown by type of company

				(millions of euro)

Share of valuation reserves connected with investments					
carried at equity	793	-	-	-681	112
Legally-required revaluations	352	-	-	-	352
Parent Company's net income (loss) and minority interest	2,806	563	-9	-554	2,806
Shareholders' equity	48,595	479	145	-626	48,593

The table above indicates the components of net book value, adding those of the Group to those of third parties, broken down by the type of consolidated company. In further detail, the column for the Banking group indicates the amount resulting from the consolidation of the companies belonging to such group, gross of the effects on the income statement of transactions with other companies within the scope of consolidation. Subsidiaries other than those belonging to the Banking group and consolidated on a line-by-line basis are stated here at equity. The columns Insurance companies and Other companies contain the amounts resulting from consolidation, gross of the effects on the income statement of transactions with companies belonging to the Banking group. The columns Netting and Adjustments on consolidation show the adjustments required to obtain the figure represented in the financial statements.

As well as due to the distribution of the dividend for 2015 (to be paid on 2014 net income) to Intesa Sanpaolo S.p.A. shareholders for a total of 1,185 million euro, consolidated shareholders' equity (Group and third parties) essentially changed over the two periods under review due to the net income for 2015, the improvement in valuation reserves and the change in several minority interests. We then report the issues of new equity instruments worth 877 million euro, as better detailed in the description of AT1 instruments. The breakdown of the different types of valuation reserves and their changes during the year are shown in the tables below.

P. Total Tier 2 (T2) (M - N +/- O)	8,089	8,043
Q. Total own funds (F + L + P)	47,299	46,290

The tables below provide a detailed summary of the various capital levels before regulatory adjustments and transitional regime adjustments, together with the reconciliation between Common Equity Tier 1 and net book value. With regard to transitional regime adjustments, note that for the eligibility of:

- grandfathered instruments;
- minority interests;
- unrealised profits or losses on instruments designated at fair value;
- negative amounts resulting from the calculation of expected losses (shortfall reserve);
- IAS 19 filter on valuation reserves for actuarial gains or losses on defined benefit plans;
- other minor captions;

the regulations envisage specific treatment allowing gradual entry into force of the rules, to be applied during the transitional period. In this respect, they state specific percentages for deductions and eligibility for Common Equity.

Full reconciliation of the components of Common Equity Tier 1, Additional Tier 1 and Tier 2 capital, as well as the filters and deductions applied to the institution's own funds and the balance sheet of the financial statements are shown at the end of this Section.

The full terms and conditions of all Common Equity Tier 1, Additional Tier 1 and Tier 2 instruments are reported in Attachment 1 to this disclosure. Attachment 2, on the other hand, reports the Transitional Own Funds Disclosure Template envisaged in the instructions issued by the EBA.

Reconciliation of net book value and Common Equity Tier 1 Capital

(millions of euro)

	31.12.2015	31.12.2014
Group Shareholders' equity	47,776	44,683
Minority interests	817	549
Shareholders' equity as per the Balance Sheet	48,593	45,232
Dividends in distribution and other foreseeable charges ^(a)	-2,383	-
Shareholders' equity following presumed distribution to shareholders	46,210	45,232
Adjustments for instruments eligible for inclusion in AT1 or T2 and net income for the period

Deductions with threshold of 15% (e) (f)		.,015
Positive or negative elements - other	-318	-296
Total regulatory adjustments to Common Equity Tier 1 (CET1)	-8,683	-8,307
Total adjustments in the transitional period (CET1)	1,457	1,787
Common Equity Tier 1 (CET1) - Total	36,908	36,547

⁽a) Amount included in CET1.

As already mentioned in the introduction to this disclosure, Art. 26, paragraph 2, of Regulation 575/2013 (CRR) envisages the option of including interim and annual profit in the regulatory capital prior to formal approval by the relevant corporate body (net of the corresponding dividends) only if:

- a) the profit has been verified by the independent auditors;
- b) the bank has proved to the competent supervisory authority that it has deducted all foreseeable charges and dividends from such profits.

It bears emphasising that Common Equity Tier 1 capital included, as a positive component, the net income for the year ended 31 December 2015, since the abovementioned conditions for its inclusion were met, and, as a negative component, the related dividend that the Management Board will propose to the Shareholders' Meeting for distribution on the net income for 2015, i.e. 14 cents per each ordinary share and 15.1 cents per each savings share, for a total dividend of 2,361 million euro.

The "Negative elements – other" mainly include the sterilisation in common equity of deferred tax assets (DTA) associated with tax realignment of a single item of goodwill. Exclusion is gradual. The amount of the filter as at 31 December 2015 is 188 million euro and, based on the Supervisory Provisions, includes the first two years and the amount attributable to 2015. The residual portion will be eliminated from the calculation of own funds by 31 December 2016.

⁽b) Net income for 2014, and the related dividend, were not included in Common Equity Tier 1 capital as at 31 December 2014, as conditions envisaged in Art. 26, paragraph 2 of (EU) Regulation 575 of 26 June 2013 (CRR) had not been met for inclusion

⁽c) Dividends on 2015 results and share of the remuneration of AT1 instruments issued on 17 September and of the portion of income allocated to chartity, net of tax.

⁽d) For details of the calculation of the deduction thresholds, refer to the specific table.

⁽e) The deductions shown refer only to DTA and Significant investments for which 10% was not deducted.

⁽f) The threshold refers to the percentage indicated by the regulations for the transitional period. In 2018 this threshold will be increased to 17.65%.

Additional Tier 1 Capital (AT1)

AT1 instruments eligible for grandfathering	1,435	1,640
Additional Tier 1 (AT1) - Total	2,302	1,700

The details of instruments making up Additional Tier 1 are provided in the following table. In particular, it is worth mentioning that on 11 September 2015 Intesa Sanpaolo launched a U.S.\$1 billion Additional Tier 1 issue targeted at the US and Canadian markets. The Additional Tier 1, issued under the U.S.\$ Medium Term Notes Programme of Intesa Sanpaolo, has characteristics in line with CRD IV provisions, is perpetual (with a maturity date tied to the duration of Intesa Sanpaolo, as set in its articles of association) and can be redeemed in advance by the issuer after 10 years from the issue date and on every coupon payment date thereafter. The coupon, payable semi-annually in arrears on 17 March and 17 September of each year from and including 17 March 2016, is equal to 7.7% per annum. If the early redemption option is not exercised on 17 September 2025, a new fixed-rate coupon will be determined for the following five years (until the next recalculation date). As envisaged in the regulations applicable to Additional Tier 1, coupon payment is discretionary and subject to certain limitations. The re-offer price was set at 100%. Considering its re-offer price, the yield is 7.70% per annum, equal to the yield of the 3-year U.S. Treasury Bill plus 275 basis points per annum.

Furthermore, it is worth mentioning that, at the beginning of 2016, Intesa Sanpaolo launched a second Additional Tier 1 issue of 1.25 billion euro, targeted at the international markets. This second issue also has characteristics in line with CRD IV provisions, is perpetual (with a maturity date tied to the duration of Intesa Sanpaolo, as set in its articles of association) and can be redeemed in advance by the issuer after 5 years from the issue date and on every coupon payment date thereafter. The issuer will pay a fixed rate coupon of 7.00% per annum, payable semi-annually in arrears every 19 January and 19 July of each year, with the first coupon payment on 19 July 2016. In the event that the early redemption rights are not utilised on 19 January 2021, a new coupon at fixed rate will be determined by adding the original spread to the 5-year Mid Swap Rate reckoned at the reset date. Such new annual coupon will be fixed for the following 5 years (until the next reset date). As envisaged in the regulations applicable to Additional Tier 1, coupon payment is discretionary and subject to certain limitations. The trigger of 5.125% of Common Equity Tier 1 (CET1) provides that, if the CET1 ratio of the Intesa Sanpaolo Group or Intesa Sanpaolo S.p.A. falls below such trigger, the nominal value of AT1 will be temporarily reduced for the amount needed to restore the trigger level, taking into account also the other instruments with similar characteristics.

Since this instrument was issued in 2016, it is not included in the table below.

As already specified, the full terms and conditions of all Common Equity Tier 1, Additional Tier 1 and Tier 2 instruments are reported in Attachment 1 to this disclosure.

Additional Tier 1 (AT1) equity instruments eligible for Grandfathering and other AT1 instruments

Issuer	Interest rate	S t e p - u p	Issue date	Expiry date	Early redemption as of	C u r e n c	Subject to grandfather ing	Original amount in currency	Contribution to regulatory capital (millions of euro)

Deduction thresholds for DTAs and investments in companies operating in the financial sector

		(millions of euro)
	31.12.2015	31.12.2014
A. Threshold of 10% for CET1 instruments of financial sector entities where the institution does not have a significant investment	3,725	3,638
B. Threshold of 10% for CET1 instruments of financial sector entities where the institution has a significant investment and for DTA that rely on future profitability and arise from temporary differences	3,725	3,638
C. Threshold for significant investments and DTA not deducted in the threshold described under point B:		
• 15% under transitional regime until 31 December 2017	5,618	5,457
• 17,65% as from 2018	5,340	0

The regulations envisage that for certain regulatory adjustments, such as those for DTAs based on future income and deriving from temporary differences, and for significant and minor investments in CET1 instruments issued by companies in the financial sector, certain thresholds or "deductibles" are specified, calculated on Common Equity estimated using different approaches.

For minor investments in CET1 instruments issued by companies in the financial sector the deduction of amounts exceeding 10% of CET1 prior to deductions deriving from exceeding the thresholds is envisaged. For significant investments in CET1 instruments and DTAs, however, an initial threshold on deductions is envisaged, still calculated as 10% of CET1 prior to deductions deriving from exceeding the thresholds, adjusted to take into account any excess over the threshold described in the previous point. A further threshold is indicated, calculated on 15% of Common Equity adjusted for the above 10% threshold, to be applied in aggregate on amounts not deducted using the first threshold.

All amounts not deducted are weighted among risk-weighted assets in accordance with the percentages envisaged in the regulations for individual cases.

As mentioned previously, these deductions are introduced gradually through the application of specific transitional rules. In addition to applying deductions with an increasing impact, these rules also envisage different treatment, compared to that applied when fully operative, for amounts not deducted.

Transitional regime adjustments

Greater details are provided below on the impact of the transitional regime on the different levels of capital for the period under review.

Section 4 - Capital Requirements

Qualitative disclosure

Assessment of the adequacy of the Bank's internal capital

The management of capital adequacy consists of a series of policies that determine the size and optimal combination of the various capitalisation instruments, in order to ensure that the levels of capital of the Group and its banking subsidiaries are consistent with the risk profile assumed and meet the supervisory requirements.

The concept of capital at risk differs according to the basis for its measurement, and different target levels of capitalisation are established:

- Regulatory Capital for Pillar 1 risks;
- overall Economic Capital for Pillar 2 risks, for the ICAAP process.

The Regulatory Capital and the overall Economic Capital differ in terms of their definition and the coverage of risk categories. The former derives from the formats laid down by the supervisory provisions and the latter from the identification of the significant risks for the Intesa Sanpaolo Group and the consequent use of internal models for the exposure assumed.

Capital Management essentially involves the control of capital adequacy through the careful monitoring of both the regulatory constraints (Basel 3 Pillar 1) and current and prospective operational constraints (Pillar 2) in order to anticipate any critical situations within a reasonable period of time and identify possible corrective actions for the generation or recovery of capital.

The processes of assessment of capital adequacy are therefore based on a "twin track" approach: Regulatory Capital for the purposes of compliance with the Pillar 1 requirements and overall Economic Capital for the purposes of the ICAAP process.

The Intesa Sanpaolo Group assigns a primary role to the management and allocation of capital resources, also to run its operations. In this regard, the allocation of capital to the Business Units is established on the basis of their specific capacity to contribute to the creation of value, taking into account the level of return expected by the shareholders. To this end, internal systems are used to measure performance (EVA) on the basis of both the Regulatory Capital and the Economic Capital, also in accordance with the criteria of the "use test" established by the supervisory provisions.

Verification of compliance with supervisory requirements and consequent capital adequacy is continuous and depends upon the objectives set out in the Business Plan.

First verification occurs as part of the process of defining budget targets: based on the growth trends expected for loans, other assets and income statement aggregates, the risks are measured and their compatibility with compulsory capital ratios for individual banks and for the Group as a whole is assessed. Compliance with capital adequacy is obtained via various levers, such as the pay-out policy, the definition of strategic finance operations (capital increases, issue of convertible loans and subordinated bonds, disposal of non-core assets, etc.) and the management of the loan policy on the basis of counterparty risk. This dynamic management approach is aimed at identifying the risk capital raising instruments and hybrid capital instruments most suitable to the achievement of the objectives.

Compliance with the target levels of capitalisation is monitored during the year and on a quarterly basis, taking appropriate actions, where necessary, for the management and control of the balance sheets aggregates.

A further step in the preventive analysis and control of the Group's capital adequacy takes place whenever extraordinary operations (such as acquisitions, disposals, joint ventures etc.) are resolved upon. In this case, on the basis of the information on the operation to be conducted, its impact on capital ratios is estimated and any necessary actions to ensure compliance with the requirement set forth by Supervisory Authorities are planned.

As already mentioned, the Intesa Sanpaolo Group attaches great importance to risk management and control to ensure reliable and sustainable value creation in a context of controlled risk.

Risk-acceptance policies are defined by the Parent Company's Supervisory Board and Management Board. The Supervisory Board carries out its activity through specific internal committees, among which mention should be made of the Internal Control Committee and the Risk Committee. The Management Board relies on the action of managerial committees, among which mention should be made of the Group Risk

Governance Committee. Both corporate bodies receive support from the Chief Risk Officer, who is a member of the Management Board and reports directly to the Chief Executive Officer. The Chief Risk Officer is responsible for proposing the Risk Appetite Framework, setting the Group's risk management guidelines and policies in accordance with company strategies and objectives and coordinating and verifying the implementation of those guidelines and policies by the responsible units of the Group, including within the various corporate departments. The Chief Risk Officer ensures management of the Group's overall risk profile by establishing methods and monitoring exposure to the various types of risk and reporting the situation periodically to the corporate bodies.

The Economic Capital, defined as the maximum "unexpected" loss that the Group may incur over a period of one year, is a key measure for determining the Group's financial structure and guiding its operations, ensuring the balance between risks assumed and shareholder return.

Consequently, when determining the risk tolerance considered to be acceptable, the Group's objective is to ensure that its liabilities are covered over a period of 12 months with a 99.9% confidence level.

With regard to systemic financial stability, the Group monitors the adequacy of capital resources, both under ordinary and stress conditions.

The Group sets out these general principles in policies, limits and criteria applied to the various risk categories and business areas with specific risk tolerance sub-thresholds, in a comprehensive framework of governance and control limits and procedures.

As presented in Section 1 of this disclosure, the risks identified, covered and incorporated within the economic capital are as follows:

- credit and counterparty risk. This category also includes concentration risk, country risk and residual risks, both from securitisations and uncertainty on credit recovery rates;
- market risk (trading book), including issuer, position, settlement and concentration risk on the trading book;
- financial risk of the banking book, mainly represented by:
- o interest rate and foreign exchange rate risk;
- o risk on equity investments not subject to line by line consolidation;
- o risk on real estate assets owned for whichever purpose;
- operational risk, also including legal risk, ICT risk and model risk;
- insurance risk;
- strategic risk.

The level of absorption of Economic Capital is estimated on the basis of the current situation and also at a forecast level, according to the definition of Risk Appetite approved by the Group, based on the Budget assumptions and the projected economic scenario under ordinary and stress conditions.

The Group's overall risk position as at December 2015 and based on the 2016 budget in terms of overall Economic Capital is defined according to an approach that envisages assessment with a 99.9% confidence interval.

The absorption of Economic Capital by Business Unit reflects the distribution of the Group's various activities and the specialisations of the business areas.

The following graphs illustrate the breakdown of the Group's Economic Capital by Business Unit and by type of risk.

Overall Economic Capital – breakdown by type of risk and by Business Unit

The absorption of Economic Capital by Business Unit reflects the distribution of the Group's various activities and the specialisations of the business areas.

The majority of risk is concentrated in the "Corporate & Investment Banking" Business Unit (36.1% of the total Economic Capital): this is attributable to the type of customers served (Corporate and Financial Institutions) and Capital Market activities. This Business Unit is assigned a significant share of credit risk and trading book risk.

The "Banca dei Territori" Business Unit (19.2% of the total Economic Capital) is the second source of absorption of Internal Capital, in line with its role as core business of the Group, serving Retail, Private and Small/Middle Corporate customers. It is assigned a sizeable portion of credit risk and operational risk.

Most of the insurance risk is assigned to the Insurance Business Unit (12.5% of the total Economic Capital).

The "International Subsidiary Banks" Business Unit is assigned 8.9% of the total risk, predominantly credit risk.

In addition to credit risk, the "Corporate Centre" is attributed with the risks typical of this Business Unit, namely those resulting from investments, the risks pertaining to the Capital Light Bank, the Banking Book interest rate and exchange rate risk, and the residual portion of insurance risk (21.4% of the total Economic Capital).

Absorption of Economic Capital by the "Private Banking" and "Asset Management" Business Units is marginal (1.7% and 0.2%, respectively) due to the nature of their businesses, which are predominantly aimed at asset management activities.

In accordance with the provisions established by the new rules on capital adequacy, the Group has completed the actions aimed at meeting the requirements laid down by the Second Pillar of Circular 263, by preparing and sending the ICAAP Reports to the Supervisory Authority - on approval by the corporate bodies – with the figures of the previous years on a consolidated basis. The Group has also substantially completed the ICAAP Report on the figures as at 31 December 2015 and the forecasts over a three-year period, and the final document is due to be sent to the Supervisor by 30 April 2016. The results of the ICAAP process confirm the Group's capital adequacy: the financial resources available ensure, with adequate margins, coverage of all current and prospective risks, also in stress conditions.

Quantitative disclosure

According to the regulations for the prudential supervision of banks (Bank of Italy Circular 285 of 17 December 2013 and subsequent amendments), which adopt the provisions on capital measurement and capital ratios (Basel 3), the Banking Group's capital must amount to at least 10.5% of total risk-weighted assets (total capital ratio) arising from the risks typically associated with banking and financial business (credit, counterparty, market, and operational risk), weighted according to the regulatory segmentation of borrowers and considering credit risk mitigation techniques and the decrease in operational risk following insurance coverage.

As already illustrated in the Section on "Own Funds", the total regulatory capital is made up of the algebraic sum of the elements specified below:

- Tier 1 Capital (capable of absorbing losses under going concern conditions). This capital is divided into Common Equity Tier 1 Capital and Additional Tier 1 Capital;
- Tier 2 Capital (capable of absorbing losses in the event of a crisis).

The elements indicated above are subject to the following limits:

- Common Equity Tier 1 must at all times be equal to at least 4.5% of risk-weighted assets;
- Tier 1 must at all times be equal to at least 6% of risk-weighted assets;
- Own funds (i.e. the total regulatory capital), equal to Tier 1 plus Tier 2 capital, must at all times be equal to at least 8.0% of risk-weighted assets.

Furthermore, in addition to top-quality capital necessary to satisfy own funds requirements, banks are expected to maintain a capital conservation buffer amounting to 2.5% of the bank's total risk exposure. The minimum capital requirements requested as from 1 January 2014 equal 7% of the Common Equity Tier 1, including the capital conservation buffer equal to 2.5%, 8.5% of Tier 1 and 10.5% of Tier Total.

Moreover, during 2015 Intesa Sanpaolo received:

- on 25 February 2015 Intesa Sanpaolo, the ECB's final decision regarding the specific capital requirements to be respected at consolidated level, i.e.: 9% in terms of Common Equity Tier 1 ratio and 11.5% in terms of Total Capital ratio;
- on 27 November 2015, the ECB's final decision concerning the capital requirements to be observed with effect from 1 January 2016, in light of the results of the Supervisory Review and Evaluation Process (SREP), which consist of a consolidated capital requirement of 9.5% in terms of the CET1 ratio.

For the sake of completeness, please note that Directive 2013/36/EU (CRD IV) establishes the obligation for the designated national authorities to activate an operational framework for the definition of the ratio of the countercyclical capital buffer (CCyB) starting from 1 January 2016. The ratio is subject to review on a quarterly basis. The European regulation was implemented in Italy with Bank of Italy circular no. 285, which contains suitable regulations concerning CCyB. Based on the analysis of the reference indicators, the Bank of Italy decided to set the counter-cyclical ratio (relating to the exposures towards Italian counterparties) for the first three months of 2016 at 0%; 2016 is the first year the counter-cyclical buffer applied.

Finally, please note that, with letter dated 25 January 2016, the Bank of Italy identified the Intesa Sanpaolo banking group as an Other Systemically Important Institution (O-SII) authorised to operate in Italy. The decision was made pursuant to Bank of Italy circular no. 285, which implements the provisions of CRD IV in Italy and specifies the criteria on which the methodology for identifying the O-SIIs is based. The identification took into consideration the contribution of the four categories (size, importance for the Italian economy, complexity, interconnectedness with the financial system) the EBA guidelines use to determine the systemic importance of each institution at individual member state level. Based on the provisions set by CRD IV, the Bank of Italy decided to apply a capital buffer (the so-called O-SII buffer) equal to 0% for 2016; it is worth remembering that 2016 is the first year of application of the O-SII-related regulation and thus of the buffer specified by the Bank of Italy.

(a) The caption includes all the other elements not considered in the p	revious captions which a	re eligible for inclu	usion in the total capi	tal requirements.		

In the case of the standardised approach, "unweighted amounts" correspond – in accordance with regulatory provisions – to the exposure value, which takes into account prudential filters, risk mitigation techniques and credit conversion factors. In the case of the internal rating based approach, "unweighted amounts" correspond to "exposure at default" (EAD). For guarantees given and commitments to disburse funds, credit conversion factors are included when determining EAD.

The tables below provide details of the Group's different capital requirements as at 31 December 2015. Additional details, for the "unweighted" amounts, are also shown:

- for the standardised approach and the securitisations subject to the standardised approach, in their specific section (which also shows the amounts of the off-balance sheet transactions before weighting for the credit conversion factors – CCF);
- for the internal models approach (including securitisations), in its specific section.

With regard to the "weighted" amounts, on the other hand, additional information on securitisations and equity instruments is provided in the specific sections dedicated to those types of exposures.

Capital requirement for Credit and Counterparty Risk

The following table breaks capital requirements down between credit risk and counterparty risk.

(millions of euro)

	Сар	Capital requirement		
	31.12.2015	31.12.2014		
Credit risk	19,002	17,778		
Counterparty risk	579	611		
Total capital requirement for credit and counterparty risk	19,581	18,389		

Counterparty risk is calculated on both the trading book and the banking book. The relative requirements are presented, for each regulatory portfolio, in the following tables.

Total capital requirement for market risk	1,326	1,318
(a) The caption includes capital requirements for exposures to securitisations for 87 million euro.		

Capital requirement for Operational Risk

(millions of euro)

	Сарі	tal requirement
	31.12.2015	31.12.2014
Basic indicator approach	45	53
Standardised approach	232	255
Advanced measurement approach	1,375	1,385
Total capital requirement for operational risk	1,652	1,693

As already noted, almost all the Group companies use the Advanced Measurement Approach (AMA) and – to a lesser extent – the Standardised Approach to determine capital requirements for operational risk. A small remaining number of companies use the Basic Indicator Approach (BIA). For the AMA Approach the requirement is recalculated on a half yearly basis, whereas for the Standardised and the BIA Approaches the requirement is only calculated annually, unless one or more Group companies change approach during the year, by migrating towards more evolved models.

Section 5 - Credit risk adjustments: general disclosure

Qualitative disclosure

Definitions of "non-performing" loans and "past due" loans

Non-performing financial assets include those loans which, due to events that occur after their granting, show objective evidence of possible impairment.

On 9 January 2015, on the proposal of the European Banking Authority (EBA), the European Commission approved the "final" version of the "Final Draft Implementing Technical Standards on Supervisory reporting on forbearance and non-performing exposures under article 99(4) of Regulation (EU) No. 575/2013".

Following this decision, the Bank of Italy issued an update to its corpus of regulations that, in line with the previous representation of the risk statuses of non-performing loans, fully reflects the new Community regulations with effect from 1 January 2015.

Based on the regulations issued by the Bank of Italy, as a function of homogeneous representation of the phenomenon, the Group continues to adopt a definition of non-performing financial assets that includes the concepts of "non-performing" exposures (introduced by the Implementing Technical Standards - EBA), "default" (in accordance with Art. 178 of Regulation (EU) No 575/2013, Capital Requirements Regulation - CRR) and the reference international accounting standards (IAS/IFRS). Consequently, the new regulatory framework, supplemented by additional internal provisions that set criteria and rules, now provides for the division of non-performing financial assets into three categories depending on their level of criticality: "doubtful loans", "unlikely to pay" and "non-performing past due exposures". Therefore, the categories of substandard and restructured exposures have been eliminated, as they have in effect been included in the "unlikely to pay" category.

The new classification "exposures subject to concessions - forbearance" has also been established. These are exposures subject to renegotiation and/or refinancing due to financial difficulties (evident or in the process of becoming evident) of the debtor, which effectively constitute a subgroup of both non-performing exposures (non-performing exposures with forbearance measures) and performing exposures (other forborne exposures), depending on the level of risk of the exposure when renegotiation occurs or as a consequence thereof.

As previously mentioned, non-performing exposures with forbearance measures do not represent a separate category of non-performing assets, rather, they are an attribute of the above categories of non-performing assets.

The process of managing such exposures, in close accordance with regulatory provisions concerning classification times and methods, is assisted by an IT tool that ensures pre-established, autonomous and independent management procedures.

Non-performing assets undergo an individual measurement process, or the calculation of the expected loss for homogeneous categories (identified as a function of the risk status, duration of default and significance of the exposure) and analytical allocation to each position, and the amount of the adjustment of each loan is the difference between its carrying value at the time of measurement (amortised cost) and the present value of expected future cash flows, discounted using the original effective interest rate.

This measurement is performed upon classification of the assets and the occurrence of significant events and, in any event, is periodically revised.

With reference to past due loans and unlikely to pay loans, the structures responsible for their management are identified, on the basis of pre-determined thresholds of increasing significance, directly at the operating points that handle the accounts, or within peripheral organisational units that perform specialist activities and within the Head Office units, which are responsible for the overall management

and coordination of these matters.

On the subject of doubtful loans, in the first half of 2015 the Group adopted a new organisational model according to which almost all (in terms of total exposure) new doubtful loan flows are to be managed by the Group's Loan Recovery Department. In particular, this model calls for:

- the assignment to the Loan Recovery Department of coordination of all loan recovery activities and direct management (for Intesa Sanpaolo and all banks in the Banca dei Territori Division) of all positions that it manages and customers classified to the doubtful category from May 2015 (with the exception of a portion of loans with individual exposures below a given threshold, collectively representing an insignificant percentage in terms of exposure with respect to total doubtful loans, which are assigned for management to new external servicers under a specific agreement and with pre-defined limits);
- the suspension (with limited exceptions) from May 2015 of assignment to Italfondiario S.p.A. of new doubtful loan flows, without prejudice to its management of the doubtful positions assigned to it until 30 April 2015;
- for doubtful positions of limited amounts, routine factoring without recourse to third-party companies on a monthly basis when they are classified as doubtful, with some specific exceptions.

The Loan Recovery Department relies on its own specialist units throughout the country to manage recovery activity for loans entrusted directly to it. As part of these activities, in order to identify the optimal strategies to be implemented for each position, judicial and non-judicial solutions have been examined in terms of costs and benefits, also considering the financial impact of the estimated recovery times.

The assessment of the loans is reviewed whenever events capable of significantly changing recovery prospects become known to the Bank. In order to identify such events rapidly, the information set relative to borrowers is periodically monitored and the development of out-of-court agreements and the various phases of the judicial procedures under way are constantly monitored.

The activity of Italfondiario S.p.A. and the new external servicers in managing the loans entrusted to them under management mandate was monitored by the responsible internal units of the Group. In particular, it should be noted that the individual measurement of loans has been conducted using similar procedures to those established for the internal management of positions, and the other management activities are subject to the guidelines similar to those established for the internally managed positions.

The classification of positions within non-performing financial assets is undertaken on proposal of both central and local territorial structure owners of the commercial relation or of specialised central and local territorial structures in charge of loan monitoring and recovery. Classification involves the use of automatic mechanisms when given objective default thresholds are exceeded. This occurs in cases of past-due loans, which are identified at the Group level, and performing positions with other forborne exposures, if such exposures become relevant for the purposes of regulatory provisions concerning reallocation to the non-performing category.

Automatic mechanisms detect any mismatches, thereby ensuring that material non-performing loans to counterparties shared between the Group's various intermediaries are subject to the required uniform convergence of management aims. Significance is represented by exceeding a pre-established warning threshold for loans classified as at the greatest risk, with respect to the overall exposure.

Automatic mechanisms within the system also ensure that positions are allocated to the risk status most representative of their creditworthiness (doubtful loans excluded) as significant default continues.

The return to performing status of non-performing exposures is governed by the Supervisory Authority and specific internal regulations, and takes place on the proposal of the Structures responsible for their management, upon verification that the critical conditions or state of default no longer exist.

Exposures classified amongst "past-due loans" automatically become performing when payment is received. The same mechanism is applied to exposures of moderate amounts previously classified as unlikely to pay when automatic mechanisms detect that the conditions that triggered reclassification no longer apply.

Non-performing loans are constantly monitored and controlled, including through second-level controls, by the Controls Department in the Group Risk Manager area.

The definitions of the various categories of "non-performing" loans are set forth below:

Doubtful loans

On- and off-balance sheet exposures to borrowers in a state of insolvency (even when not recognised in a court of law) or in an essentially similar situation, regardless of any loss forecasts made by the Bank; irrespective, therefore, of whether any collateral or guarantees have been established to cover the exposures. Exposures whose anomalous situation may be attributed to Country risk are excluded from this category;

Unlikely to pay:

exposures for which - according to the judgement of the creditor bank - full repayment is unlikely (in terms of capital or interest, and without considering recourse to actions such as enforcement of collateral arrangements). This assessment is conducted regardless of the presence of any amounts (or instalments) due and unpaid. As the assessment of unlikelihood of repayment is at the discretion of the Bank, it is not necessary to await an explicit symptom of anomaly (non-repayment), when there are elements that imply a risk of non-compliance by the borrower (for example, a crisis in the industrial sector in which the borrower operates). The set of on- and off-balance sheet exposures toward the same debtor in said situation is therefore classified under the category "unlikely to pay" (unless the conditions for classification of the debtor among doubtful loans exist). Loans classified as "unlikely to pay" should include exposures to issuers who have not regularly honoured their repayment obligations (in terms of capital or interest) relating to listed debt securities, unless they meet the conditions for classification as doubtful loans. To this end the "grace period" established by the contract is recognised or, in its absence, the period recognised by the market listing the security.

The Intesa Sanpaolo Group's policy - in addition to what is expressly and specifically indicated by Circular 272 - envisages that exposures classified as "unlikely to pay" also include non-performing past due or overdrawn loans subject to restructuring and which, following restructuring, no longer have past due days ¹. As envisaged by the reference regulations, classification in the non-performing category is maintained for twelve months following completion of restructuring;

Past due exposures

On- and off-balance sheet exposures, other than those classified as doubtful or unlikely to pay that, as at the reporting date, are past due or overdrawn by over 90 days on a continuous basis. This is irrespective of whether any collateral or guarantees have been established to cover the exposures.

Forborne exposures

The concept of forbearance has also been introduced into supervisory regulations. In this context, the notion of "forborne assets", introduced by European provisions, transversally applies to the loan classification macro-categories (performing and non-performing). Forborne exposures are subdivided into:

- exposures subject to non-performing forbearance measures, which correspond to the "Non-performing exposures with forbearance measures" pursuant to the aforementioned ITS. These exposures represent a feature, depending on the case, of doubtful loans, unlikely to pay loans or non-performing past due and/or overdrawn exposures; therefore, they do not form their own category of non-performing loans;
- other exposures subject to forbearance measures, which correspond to the "Forborne performing exposures" pursuant to the ITS.

The definition of "forborne exposures" is directly connected to that of forbearance measures. The latter represent forbearance measures for a borrower that is facing, or is about to face, difficulties in meeting their payment obligations (troubled debt).

The term "forbearance measures" indicates contractual modifications granted to the borrower undergoing financial difficulties (modification), as well as the disbursement of a new loan in order to satisfy the pre-existing obligation (refinancing). "Forbearance measures" include contractual modifications, which may be freely requested by a borrower with regard to a contract already signed, but only if the lender believes the borrower to be in financial difficulty (the so-called "embedded forbearance clauses").

¹ Maintenance of the restructured exposures in the categories of non-performing loans follows the provisions of the EBA's ITS, according to which a loan that is granted "forbearance measures" must be included under "non-performing" exposures for at least twelve months from the restructuring. This provision is valid solely for renegotiations with borrowers having "non-performing" status upon restructuring or that become non-performing directly following restructuring.

Description of the methods adopted to calculate the adjustments

At every balance sheet date the financial assets not classified under Financial assets held for trading or Financial assets designated at fair value through profit and loss are subject to an impairment test to assess whether there is objective evidence to consider that the carrying value of these assets is not fully recoverable.

A permanent loss occurs if there is objective evidence of a reduction in future cash flows with respect to those originally estimated, following specific events; the loss must be quantified in a reliable way and must be incurred and not merely expected.

The measurement of impairment is carried out on an individual basis for financial assets which present specific evidence of losses and collectively for financial assets for which individual measurement is not required or which do not lead to adjustments. Collective measurement is based on the identification of portfolios of financial assets with the same risk characteristics with respect to the borrower/issuer, the economic sector, the geographical area, the presence of any guarantees and other relevant factors.

With reference to loans to customers and due from banks, positions attributed the status of doubtful, unlikely to pay or past due according to the definitions of the Bank of Italy, consistent with IAS/IFRS, are subject to individual measurement.

These non-performing loans undergo an individual measurement process, or the calculation of the expected loss for homogeneous categories and analytical allocation to each position, and the amount of the adjustment of each loan is the difference between its carrying value at the time of measurement (amortised cost) and the present value of expected future cash flows, discounted using the original effective interest rate.

Expected cash flows consider forecast recovery periods, presumed realisable value of guarantees as well as the costs sustained for the recovery of credit exposure. Cash flows relative to loans which are deemed to be recovered in the short term are not discounted, since the time value is immaterial.

Loans for which no objective evidence of loss has emerged from individual measurement are subject to collective measurement. Collective measurement occurs for homogeneous loan categories in terms of credit risk and the relative loss percentages are estimated considering past time-series, founded on observable elements at measurement date, that enable to estimate the value of the latent loss in each loan category. Measurement also considers the risk connected to the borrower's country of residence.

The determination of provisions on performing loans is carried out by identifying the highest possible synergies (as permitted by the various legislations) with the supervisory approach contained in the regulations known as "Basel 3". In particular, the parameters of the calculation model set out in the supervisory provisions, namely Probability of Default (PD) and Loss Given Default (LGD), are used – where already available – also for the purposes of financial statement valuation. The relationship between the two aforementioned parameters represents the starting point for loan segmentation, since they summarise the relevant factors considered by IAS/IFRS for the determination of the homogeneous categories and for the calculation of provisions. The time period of a year used for the determination of the probability of default is considered suitable to approximate the notion of incurred loss, that is, the loss based on current events but not yet included by the entity in the review of the risk of the specific customer, set forth by international accounting standards. This time period is reduced to six months for counterparties who are natural persons. This reduction is based on a statistically significant sample of mortgages that showed an average period of six months between the first missed payment and the classification as default. The time period of a year is decreased by 30% for the factoring segment, in order to take into account certain specific characteristics related to the activity of acquiring short-term trade receivables.

The amount of the provision also reflects the phase of the economic cycle through an appropriate corrective factor: an annually updated adjusting coefficient, estimated on the basis of the economic cycle, made necessary by the fact that ratings, which are calibrated according to the long-term expected average level throughout the economic cycle, only partially reflect current conditions. This coefficient is determined by regulatory segment and is equal to the ratio of the default rates estimated for the following 12 months on the basis of the scenario available in the fourth quarter (used in ICAAP) to actual PD. Cyclical coefficients are updated annually and submitted to the Chief Risk Officer for approval.

With reference to assets available for sale, the process of detection of any impairment involves the verification of the presence of impairment indicators and the determination of any write-down.

The impairment indicators are essentially divided into two categories: indicators deriving from internal factors relating to the company being valued, and therefore qualitative, and - for equities - external quantitative indicators deriving from the market values of the company.

Within the first category, the following indicators are considered significant: the generation of negative economic results or in any case a significant variance with respect to the targets budgeted or established

in the multi-year plans disclosed to the market, the announcement/start-up of insolvency proceedings or restructuring plans, and the downgrading by more than two categories of the rating. With respect to the second category, a significant or prolonged reduction in fair value below the initial recognition value is particularly important. Specifically, in relation to the latter amount, a fair value reduction of over 30% is considered significant, and a reduction of over 24 months is considered a "prolonged" continuous reduction. If one of these thresholds is exceeded, impairment of the security is carried out. If these thresholds are not exceeded but other impairment indicators are present, recognition of the impairment must also be corroborated by the result of specific analyses of the security and the investment. The amount of the impairment is calculated with reference to the fair value of the financial asset.

Provisions made on an individual and collective basis, relative to estimated possible disbursements connected to credit risk relative to guarantees and commitments, determined applying the same criteria set out above with respect to loans, are recorded under Other liabilities, as set out by Bank of Italy instructions.

Quantitative disclosure

As required by the regulations, the information in this Section is provided solely with respect to the Banking Group, as defined in the Supervisory Instructions.

The tables that refer to the Banking Group alone include the share proportional to the interest held of the assets and liabilities of jointly controlled banking, financial and instrumental companies consolidated proportionally for regulatory purposes. The values of transactions with entities not included in the Banking Group, recorded in the consolidated financial statements alone pursuant to IAS/IFRS, were not netted.

The following table contains the reconciliation of the consolidated balance sheet with the regulatory-scope balance sheet.

Asse	ts	31.12.2015 Financial Statements	Effects of the deconsolidation and consolidation of counterparties other than those in the banking group (*)	31.12.2014 Regulatory- scope balance sheet

220.	Net income (loss)	2,739	-	2,739

 ^(*) The effects are attributable to:
 - deconsolidation of companies that are not part of the Banking Group;
 - proportional consolidation of the jointly controlled companies that are consolidated at equity in the financial statements.

The tables below show the Gross credit exposures - total and average - and the related adjustments broken down by risk class, geographical area, counterparty category and residual maturity, together with the adjustments made during the period. The figures represent the exposures shown in the financial statements, and include both the positions relating to the banking book and the regulatory trading book. "On-balance sheet exposures" include all on-balance sheet financial assets claimed from banks and customers, irrespective of their portfolio of IAS/IFRS allocation: An exception is represented by equity exposures which, consistently with the Annual Report (Part E of the Notes to the financial statements – Credit risk) regulated by Circular 262 of the Bank of Italy, are excluded from this disclosure. Equity exposures included in the banking book are detailed in the specific Section hereof. In compliance with the provisions already referred to, the units of UCI are included only in the Residual maturity table.

"Off-balance sheet exposures" include all financial activities that are not on the balance sheet (guarantees given, Irrevocable commitments to lend funds, derivatives, etc.) but entail the assumption of credit risk, regardless of the purpose of such activities (trading, hedging, etc.). Off-balance sheet exposures also include counterparty risk associated with securities lending operations, repurchase agreements and lending transactions with margins within the notion of SFTs (Securities Financing Transactions) defined in prudential regulations.

The following table presents such exposures by risk class and IAS/IFRS portfolio, also including in the "Financial assets held for trading" portfolio derivatives positions not already classified to the Hedging derivatives portfolio. In this regard, consistently with the Annual Report (Part E of the Notes to the financial statements – Credit risk) regulated by Circular 262 of the Bank of Italy, the amounts relating to Financial assets held for trading and Hedging derivatives are conventionally included under performing exposures. For data relating to the previous year, please refer to the document Basel 3 - Pillar 3 - Disclosure as at 31 December 2014, which discloses information on the basis of previous risk classes.

(*) This table provides figures pertaining exclusively to the Banking Group.

The above table of "Credit exposures and adjustments to customers by counterparty" includes exposures to SMEs for a total amount (on- and off-balance sheet exposures net of value adjustments) of 93,268 million euro (118,753 as at 31 December 2014).

The breakdown by maturity of financial assets is shown in the table below according to the rules set forth in financial statement regulations (Bank of Italy Circular 262 and related clarifications issued by the Supervisory Authority), using accounting information organised by contractual residual maturity. Therefore, no operational data was used that would require, for example, the representation of cash items according to their level of liquidability.

Section 6 - Credit risk: disclosures for portfolios subject to the standardised approach

Qualitative disclosure

External agencies used

For the determination of the risk weightings under the standardised approach, the Intesa Sanpaolo Group uses the ratings of the following external agencies for all of its portfolios subject to the reporting: Standard & Poor's Ratings Services, Moody's Investors Service, Fitch Ratings and DBRS Ratings. These agencies are valid for all Group banks.

In compliance with the regulations, if there are two ratings for the same customer, the most prudential of the two is used; when three ratings are available, the middle rating is adopted, and when all ratings are available, the second-best is taken.

Process of transfer of the issuer or issue credit ratings to comparable assets not included in the regulatory trading book

In compliance with EU Regulation 575/2013 (CRR) the criteria have been defined, as described below, for the use of issue and issuer credit ratings for the assessment of exposure risks and guarantee mitigation. The risk weighting assigned to the exposures has been determined, in general for all the regulatory portfolios, using the issue rating as the primary measure and then, when this is not available and the conditions established by the Regulation are met, through the use of the issuer rating. The same priority has been used in general for all the regulatory portfolios to determine the eligibility of the guarantees and the regulatory volatility corrections to be allocated. For the unrated issues of supervised issuers, the extension of the eligibility is strictly subject to the conditions established by the regulations (listing in regulated markets, non-subordinated securities, and issues of the same rank associated with classes 1 to 3 of the credit quality rating scale).

Quantitative disclosure

The quantitative disclosures provided in this Section complement those provided in the section dedicated to risk mitigation techniques. In fact, each regulatory portfolio provided for by regulations under the standardised approach is broken down as follows:

- amount of on- and off-balance exposures, "without" the risk mitigation, which does not take into
 account the decrease in exposure arising from application of collateral and guarantees; in the case of
 guarantees, which transfer risk in respect of the guaranteed portion, reference is made to the
 guarantor's regulatory portfolios and weightings, while as to the residual exposure, reference is made
 to the guaranteed party's information;
- amount of the same exposures "with" the risk mitigation effect, i.e. net of the guarantees mentioned in the previous point. the difference between exposures "with" and "without" credit risk mitigation thus represents the amount of approved guarantees, disclosed in section dedicated to risk mitigation techniques.

The above information is listed in the "with" and "without" credit risk mitigation columns and associated with the risk weightings defined by the current Prudential Supervisory regulations.

The exposures listed in the columns "Exposures with credit risk mitigation" and "Exposures without credit risk mitigation" also contain the off-balance sheet exposures in relation to guarantees and commitments (including the margins available on lines of credit) without the application of the credit conversion factors (CCF) required by the prudential regulations. The off-balance sheet exposures in relation to guarantees and commitments are disclosed side by side with the counterparty weighting factor.

Please note that exposures backed by collateral - whose exposure level is reduced due to application of the comprehensive method as provided for by applicable regulations - are conventionally represented side by side with 0% weighting in the table "Exposures without credit risk mitigation".

The column "Exposures deducted from regulatory capital" reports all the exposures not considered for the purposes of determining the weighted assets, as they are directly deducted from the regulatory capital (see Own Funds).

Total credit risk	310,976	375,241	1,768	284,843	337,821	1,315

For certain regulatory portfolios (Exposures to or secured by corporates, Retail exposures and Exposures secured by real estate property), the Group uses the standardised approach to a lesser extent, as it obtained authorisation to use the IRB approaches. For information on the different scope of companies which the IRB approaches are applied to, see the information disclosed in the specific section.

The exposure value shown in the tables of this section is stated net of adjustments.

Further details on the amounts of exposures with or without credit risk mitigation are provided in the following two tables.

Section 7 - Credit risk – disclosures for portfolios subject to IRB approaches

Qualitative disclosure

Credit risk – disclosures for portfolios treated under IRB approaches

The rollout plan for the internal models

The supervisory regulations provide for two approaches for the calculation of the capital requirement: the Standardised approach and the Internal Rating Based (IRB) approach, in which the risk weightings are a function of the banks' internal assessments of their borrowers. The IRB approach is in turn divided into a Foundation Internal Rating Based (FIRB) approach and an Advanced Internal Rating Based (AIRB) approach that differ in the risk parameters that banks are required to estimate. Under the foundation approach, banks use their own PD estimates and regulatory values for the other risk parameters, whereas under the advanced approach the latter are also estimated internally. Given that the rating systems for retail exposures must reflect both the borrower risk and the specific risk of the transaction, in this case there is no distinction between the foundation and the advanced approach.

As illustrated in the first Section of this document (paragraph "Basel 3 regulations and the Internal Project"), the Group is also proceeding with development of the rating models for the various segments and the extension of the scope of companies for their application are continuing in accordance with the gradual rollout plan for the advanced approaches presented to the Supervisory Authority.

However, the rollout plan does not include certain exposures, which are the subject of a request for authorisation for the permanent partial use of the standardised approach. These relate to the following in particular:

- exposures to central governments and banks;
- exposures to the banking group;
- exposures to minor operational units;
- non-significant exposure classes in terms of size and level of risk (this category includes loans to non-banking financial institutions).

Description of the structure, use, management processes and control mechanisms of the internal rating systems of the Corporate segment and the Residential Mortgages segment

Structure of the internal rating systems (PD)

The main features of the rating systems used are as follows:

- the rating is determined at counterparty level;
- the rating is based at Group level, and is the same for each counterparty, even when it is shared by several entities of the Group;
- the definition of default used corresponds to unlikely-to-pay, doubtful and past due loans (see Section 5), also taking into account the cure rate (return to performing) for the technical default loans, and is the same across the Group and within its various uses (development, backtesting, disclosure, etc.);
- the data used for the estimate relate as far as possible to the entire Group; where this is not possible, stratification criteria have been used, to render the sample as representative of the Group as possible;
- the length of the historical series used for the development and calibration of the models has been determined on the basis of a compromise between the need to cover a broad timescale and the need to represent the structure of the Group for the future;
- the segmentation of the rating models has been determined in accordance with both legislation and process and regulatory criteria;

- within the segmentation identified, uniform models have been used as much as possible, although a
 differentiation has been made where appropriate on the basis of analytical criteria considered to be
 relevant (e.g. revenue, geographical area, etc.); this differentiation can occur at the development or
 the calibration phase;
- the models incorporate financial, performance and qualitative components. With regard to the Corporate segment, the manager must also provide an independent assessment of the counterparty's creditworthiness and if the assessment differs from the rating, the manager must implement the override procedure. This procedure provides for the immediate confirmation of the proposed rating in the event of a conservative override and the validation by an independent unit in the case of an improving override. The choice of giving a significant role to the human component enables the rating models to take account of all the information available, including the latest updates or data that would be difficult to incorporate into an automated model;
- the rating is reviewed at least once a year, in conjunction with the review of the loan; Intesa Sanpaolo
 has established procedures that increase the frequency of update when there are signs of
 deterioration of credit quality.

The output PD of the models is mapped on the internal Master Scale, which is broken down into a different number of classes depending on the model type.

The table below illustrates the correspondence between the (n) internal rating classes and the ratings by the major agencies: Standard & Poor's Ratings Services, Moody's Investors Service, Fitch Ratings and DBRS Ratings. As indicated in the table, compared to the counterparties rated with Large Corporate Italia and International Corporate models where there is full correspondence with the classes of Rating Agencies, the counterparties rated with other models have a cap on Rating and, therefore, on their reported PD.

Structure of the internal rating systems

The main features of the LGD models are as follows:

- the LGD is calculated by analysing losses suffered by the Group on historical defaults ("LGD workout");
- the definition of default used is the same as that applied in the PD estimation models;
- the LGD is based at Group level, and is the same for each counterparty/relationship, even when they are shared by several entities of the Group, and characterised by the same discriminating variables;
- the data used for the estimate relate to the Parent Company, to the main Network Banks and to the product companies Leasint and Mediofactoring, now merged into Mediocredito;
- the segmentation of the LGD models has been determined in accordance with both legislation and process and regulatory criteria;
- within the segmentation identified, uniform models have been used, suitably differentiated on the basis of analytical criteria considered to be relevant;
- the LGD model is based on the concept of "Economic LGD", namely the present value of the cash flows obtained in the various phases of the recovery process net of any administrative costs directly attributable to the exposure as well as the indirect management costs incurred by the Group;
- the approach used involves the econometric estimation of an LGD model observed starting from the classification of the loan as doubtful, and the subsequent recalibration of said estimate on definition of default using the Danger Rate model.
- for the Doubtful loans model, the length of the historical series used, although impacted by the unique company characteristics, meets the need to cover a broad timescale and is based on an

extensive historical series, while the Danger Rate model meets the need to represent the structure of the Group for the future and is based on observation of defaults in the most recent periods.

Use of the rating systems (PD and LGD)

The ratings are decisive in the process of granting credit and its monitoring and management, and also in pricing, the financial statement processes, the calculation of economic capital, value governance, and reporting, as described below.

Credit granting

The granting of credit involves the use of the rating as an essential reference for the various phases of the process of approving a line of credit for a counterparty. In particular, the rating determines:

- the assignment of the Credit Strategies and Rules for the granting and managing of loans, which govern the procedures the Bank intends to adopt in assuming risk towards its customers, with the aim of promoting the balanced growth of loans to counterparties of the highest standing, and regulating the issue of credit to customers with lower credit quality, also directing them towards lines of credit with higher levels of guarantees;
- the exercise of the powers assigned, for which the Risk Weighted Asset was taken throughout the year as a parameter to define the credit granting limits of each decision-making Body.

The new methodology represents an evolution of the previous system for defining the delegated profiles, which already included PD and LGD among the main reference drivers, and allows a more accurate grading of the delegated risk, allowing low-risk customers to expand their operations and, simultaneously, bringing the more risky positions to the attention of the higher delegated Bodies.

Credit Risk Appetite

Within the scope of the 2015 Group RAF a specific RAF on Credit Risk Appetite has been introduced, aimed at outlining the bank's risk tolerance.

The CRA takes the form of a new framework, applicable to domestic customers in the (performing) Corporate and SME Retail regulatory segment, with the aim of identifying portions of the portfolio featuring potential growth or to keep under control, through a risk/return-based approach. In particular, the CRA:

- uses tools such as rating and statistically predictive risk/resilience indicators in credit risk;
- defines constraints on the maximum tolerated risk, within which the business can be conducted by means of actions aimed at managing the expected loss;
- provides guidance on the use of lines of credit with higher levels of guarantees in cases of counterparties for which credit risk mitigation is necessary.

Credit monitoring and management

Customer credit risk is continuously monitored. In particular, the new Proactive Credit Management process is aimed at intercepting and promptly managing customers who show more or less severe signs of difficulty to anticipate the implementation of the most suitable actions to remove the anomalies and restore the relationship of trust. The new process provides a specialised dedicated chain in the Regional Governance Centres, the CIB Division and the CLO structures. The positions are intercepted monthly on the basis of several indicators, and are managed according to the risk level established within a structured process with preset rules. The activities involve the re-examination of the positions intercepted via the updating of the rating, if necessary, the adjustment of the credit policies, and the establishment of operational procedures aimed at minimising the risk.

The monitored PD is calculated centrally on a monthly basis, using the same engine as the online PD, and is therefore capable of capturing the changes in the counterparty's credit rating because it is able to make use of both the updated financial and behavioural information. The comparison between the online PD and the monitored PD enables the highlighting of the state of the risk profile of the counterparties. In all cases where the minimum set threshold is breached, the online rating becomes "non-performing" and must be re-assigned.

Pricing

The Group has a model to calculate the correct pricing of credit risk, able to quantify the minimum spread with respect to the internal rate of transfer of funds that the business must implement in order to ensure the coverage of the expected loss, the cost of capital and all the items that enable the generation of value.

Financial Statement Processes

The ratings (PD and LGD) contribute to the preparation of the Financial Statements and the drafting of the Notes to the financial statements through: the collective valuation of performing loans, transforming the expected loss into incurred loss in accordance with the IAS/IFRS; the fair value measurement of derivatives and financial assets available for sale; and the drawing up of tables of distribution of assets by rating class and the presentation of the banking book at fair value in the Notes to the financial statements.

The LGD is also used in preparing the Financial Statements through the statistical valuation of Past Due Loans by over 90 days, irrespective of the amount of the exposure, and of loans classified as unlikely to pay and doubtful loans, up to cash exposure of 2 million euro (the previous threshold of 1 million euro was raised in November 2015).

Calculation of economic capital and value governance

In accordance with the provisions of the Second pillar, the methods used to estimate the Economic Capital are based on internal rating models (for both the PD and the LGD component). Through the regulatory and economic capital, the internal ratings contribute to the determination of the Group's value creation during both the assignment of targets to the Business Units and the operational performance measurement.

Reporting

The rating and the LGD form the basis of the management reporting and are spread across the risks of the loan portfolio.

For the management reporting, the Enterprise Risk Management Department produces the Risks Tableau de Bord on a quarterly basis that provides an overall view of the Group's risk position at the end of the respective quarter with reference to the combination of all the risk factors, according to the layout established by Basel 3 (Pillar 1 and Pillar 2). The main items that are analysed in the Risks Tableau de Bord are absorbed capital (regulatory vs. Economic) and specific measurement criteria for each individual risk (e.g. sensitivity and expected loss) and the monitoring of limits defined within the scope of the Risk Appetite Framework.

The process for managing and recognising credit risk mitigation techniques

The proper monitoring of credit risk mitigation instruments is ensured by a detailed management system which identifies roles, responsibilities, rules, processes and support instruments, in charge of verifying compliance with general and specific requirements set forth by regulatory provisions for the various approaches. The general and specific requirements may be summarised as:

- technical and legal requirements: aimed at ensuring the legal certainty and the effectiveness of the guarantees, and specific to the characteristics of the individual types of guarantee;
- specific requirements: established for each type of guarantee in relation to its specific features, they
 are aimed at ensuring that the credit protection is highly effective;
- organisational requirements: general requirements aimed at ensuring an efficient system for the management of credit risk mitigation techniques that oversees the entire process of acquisition, valuation, control and implementation of the Credit Risk Mitigation (CRM) instruments.

For each type of guarantee, analyses are carried out to verify the admissibility of the protection instrument in the various regulatory approaches. Through these analyses, each type of guarantee can be classified, ex ante, into one of the following categories:

- admissible types: these are types of guarantees which, in general, comply with the generic and specific requirements detailed by regulations;
- non-admissible types: these are types of guarantees which do not meet the generic and/or specific requirements set forth by regulations.

As already highlighted in the first Section of this document, detailed processes govern the material acquisition of individual guarantees, identifying the responsible structures as well as the methods for correct finalisation of guarantees, for filing documentation and for complete and timely reporting of the related information in the applications. The set of internal regulations and organisational and procedural controls is aimed at ensuring that:

- all the fulfilments are planned to ensure the validity and effectiveness of the credit protection;
- for generally and normally used guarantees, standard contracts are defined, accompanied by instructions for use;

- the methods for approving guarantee documents deviating from the standard by structures other than those in charge of commercial relations with the customer are identified.

If the individual guarantees acquired are an admissible type, they are subject to accurate, regular control using a specific application, the CRM verifier, in which a series of tests have been implemented to confirm the effective compliance with the requirements. The support application verifies whether the guarantees received are eligible with reference to each of the three methods permitted by the regulations for calculating capital requirements. Based on the specifics of each category, the eligibility results are defined at the level of individual guarantee for unfunded guarantees (usually personal guarantees) or, for collateral, for each asset or financial instrument.

An overall revision of the rules, processes and instruments concerning guarantees received and, more generally, instruments that mitigate credit risk is underway. The goal of these activities is to increase the efficiency of management, reduce the related operational risks and increase the level of eligibility of the guarantees. Following a detailed analysis, the requirements and architecture of a new application platform to manage all the phases in the lifecycle of a guarantee (acquisition, modification, extinction, enforcement, control, monitoring and custody) were defined. Releases of the module for managing the personal guarantees of the Italian banks and international branches began in June 2015 and were completed in January 2016. Subsequent implementations, relating to real-estate and financial guarantees, will occur gradually, starting in the first quarter of 2016, with the creation of a group register of assets used as collateral, leading up to the activation of the real estate collateral module, which will be completed by the third quarter of 2016.

Control and auditing of the rating systems

A prerequisite for the adoption of internal risk measurement systems for the calculation of the regulatory capital is an internal validation and auditing process for the rating systems, both during their establishment, aimed at obtaining the authorisation from the Supervisory Authorities, and during their ongoing operation/maintenance once the authorisation has been given.

The function responsible for the internal validation process for the Intesa Sanpaolo Group is the Internal Validation office, which operates independently from the functions that manage the development activities and from the function responsible for the internal audit. Specifically, this department is responsible for continuously and interactively validating risk measurement and management systems in order to assess their compliance with regulatory provisions, operational company demands and the reference market.

Therefore, with regard to the macro processes of adoption, extension, management and control of the internal measurement systems for credit risk, the following activities are assigned exclusively to the Internal Validation office:

- validation aimed at assessing the adequacy of the system with respect to the regulatory requirements and to the operational demands of the business and the target market, and formulation of an opinion on the overall performance of the systems, their proper functioning and effective use within the various areas of business management, also identifying any problems and necessary improvements;
- preparation of the validation report to be presented to the Management Board and the Supervisory Board to accompany the resolution for the certification of compliance of the internal system with the regulatory requirements and the application for authorisation to the Bank of Italy;
- regular issue of recommendations to the development functions in relation to the performance, operation and use of the internal systems;
- periodic analyses of the consistency of the corrective measures in case of critical issues/areas of improvement of the system highlighted by the same Internal Validation function and the Supervisory Authority, based on the progress report periodically provided by the Credit Risk Management Department;
- regular analyses aimed at assessing the performance, proper functioning of the internal system and the provision of the related information to the internal auditing function and the competent managerial Committee;
- preparation of the annual validation report highlighting any problems/areas for improvement of the system to be submitted to the attention of the development functions, the internal auditing function and the Corporate Bodies;
- supervision and coordination of the local validation activities carried out by the corresponding functions of the Group companies, when existing, both in the first adoption/extension phase and in the annual validation phase.

The internal auditing function for the Intesa Sanpaolo Group is assigned to the Internal Auditing Department. This department conducts assessments of the entire process of adoption, extension, management and control of the internal measurement systems for credit risk in accordance with the procedures and the areas of responsibility established by the company regulations and on the basis of a specific work plan.

Specifically, this department is responsible for assessing the effectiveness of the overall structure of the control system overseeing the process of measurement, management and control of the Group's exposure to credit risk also through the regular audit of the internal validation process for the related models developed in accordance with Basel 3 and the Prudential Supervisory regulations.

The Internal Auditing Department is therefore responsible for the activities of:

- internal audit aimed at verifying the compliance of the risk measurement systems with the requirements established by the regulations;
- assessment of the effectiveness of the overall structure of internal controls:
 - o audit of the internal validation process (assessment of the adequacy/completeness of the analyses conducted and the consistency of the results);
 - o audit of the first and second level controls;
- assessments of the effective operational use of the internal risk measurement systems;
- verifications of the completeness and reliability of the IT system;
- drafting of the relevant report accompanying the application for authorisation to the Bank of Italy;
- self-assessment of the Group's ICAAP process;
- periodic review of the disclosure process pursuant to Pillar 3;
- drafting of the annual internal auditing report with presentation to the competent Corporate Bodies, also in relation to the corrective action plan in case of critical issues/areas of improvement highlighted by the same Internal Auditing, Internal Validation function and the Supervisory Authority, based on the progress report periodically provided by the Credit Risk Management department;
- steering and practical coordination of Auditing departments in the subsidiaries, to guarantee control
 consistency with the actions of the Parent Company.

The macro process of adoption, extension, management and control of the Internal Systems involves a series of structured phases shared within the Group and arranged as follows:

- definition of the Internal System and activation of the strategic management for the adoption of the Internal Systems;
- development and adoption of the Internal System;
- extension of the Internal System;
- management, maintenance and updating of the Internal System, including the significant amendments to the Internal System already authorised;
- internal verifications, consisting of periodic validation and internal auditing.

Description of the regulatory Corporate segment internal rating systems (PD)

The regulatory Corporate segment consists of companies or groups of companies with exposure of the Banking group of over 1 million euro or with consolidated revenue of over 2.5 million euro.

Two groups of models and associated credit processes have been developed in the segment. The first of these involves Italian and foreign non-financial institutions. The second refers to "specialised lending" and in particular to project finance, asset finance and, more generally, real estate development initiatives. Specific models for the Slovak market are in use at the subsidiary VUB.

The Corporate Italia and Large Corporate Italia models

The Corporate Italia rating model applies to the Italian unrated Corporate customers (i.e. not assigned an agency rating) belonging to the manufacturing, commercial, services, long-term production and real estate sectors, and it can be used for both standalone and consolidated financial statements.

The definition of default (impairment) used comprises Past Due, Unlikely to pay and Doubtful loans, net of "technical defaults".

The model consists of two modules, one quantitative and the other qualitative, which generate an overall rating that may be altered by the proposing manager, by amending it according to the rules established in the override process.

Each customer's initial score is calculated by means of a linear combination of appropriately converted indicators originating from two quantitative areas (a finance area - whereby the main financial statement indicators are used to assess profitability and debt servicing, the capital structure and management of working capital - and a performance area). The model is optimised per revenue band and is called "Financial" when only the financial statement information is available, and "Financial-Performance" when the set of information also includes the data from "Centrale dei Rischi". The historical data used for the estimate cover the period from 1999 to 2006.

The score is converted into a probability of default (PD) via a calibration (differentiated according to revenue band and macro geographical area), on long-term past experience ("central trends"), to reflect the customer's structural characteristics while limiting the influence of economic cycle fluctuations on the risk.

The PD is then translated via the master scale into classes of credit rating, obtaining the statistic rating. The reference period for calibration which initially covered the period 2005-2009 has been updated until 2012 and consequently the Master Scale values (macro class R) were changed.

In between the quantitative and the qualitative module there is a comparison with an internal performance indicator of the counterparty's level of risk, which considers various behavioural aspects of the customer (trend in relationship with the Bank, with the System, regular transactions, etc.), which in certain cases can worsen the risk class.

The qualitative module consists of a questionnaire through which the manager provides a structured assessment of the company, broken down into several areas of analysis (economic and financial, business risks, sector and position, strategies and company plans, ownership structure, management and Group influence). For the Large Corporate counterparties (domestic counterparties with an annual counterparty revenue of over 500 million euro that have not been assigned a rating by one of the main agencies) a specific qualitative questionnaire is used, adapted with suitable adjustments from the questionnaire used for the assessment of the international counterparties (see below).

The model's output is broken down into several areas of analysis, with respect to which the manager is required to provide an independent assessment that interacts with the model's output as part of the abovementioned override procedure, determining the final rating.

The International Corporate models

The International Corporate segment is assessed on the basis of two different models, both developed on the basis of a shadow rating approach, namely using the agency rating as a target estimation variable instead of the performing/default status. This set up was required because of the small number of defaults recorded in this segment in the Bank's historical databases.

The International Large Corporate rating model applies to non-resident customers with a revenue of over 500 million euro and to Italian corporate customers with an agency rating (rated)¹, whereas the International Middle Market model is used to assess non-resident customers with a revenue of less than 500 million euro.

For the international models the override procedure is activated by a comparison with the agency rating, if available, or by providing an assessment over several areas of analysis, in the same way as the Corporate Italia segment, for unrated counterparties.

¹ Those assigned a rating by at least one of the main Agencies (Standard & Poor's, Moody's, Fitch and DBRS Ratings).

a) The International Large Corporate model

Like the Domestic Corporate segment, this model consists of two modules, one quantitative and the other qualitative, which generate an overall rating that may be altered by the proposing manager, by amending it according to rules established in the override process.

The quantitative module is estimated on a sample of international businesses with an agency rating, and generates a score that is the linear combination of financial statement indicators.

The qualitative model consists of a questionnaire divided into two areas of analysis (sector and competitive position and the specific features of the counterparty). The two parts of the qualitative module generate scores that are supplemented by the quantitative score on a statistical basis, producing an overall score that is then calibrated on a central trend representing the long-term default rate of the portfolio concerned.

b) The International Middle Market model

Unlike the models described above, this model only has one module containing both quantitative indicators, automatically updated from the financial statement figures, and qualitative indicators, integrated into a linear combination.

The score is calibrated in the same way as in the International Large Corporate segment, also in terms of the benchmark PD.

The Specialised Lending models

The Specialised Lending segment is covered by various models for the different exposure categories, in particular Project Finance, Real Estate and Asset Finance.

a) The Project Finance model

The model is used to assess the exposures of vehicle companies whose sole purpose is to implement and manage a specific project (large infrastructures, systems, etc.). The model consists of a quantitative model, which unlike the standard econometric models, is based on a Monte Carlo simulation of the future cash flows, using the project's prospective economic and financial information. The model includes a qualitative questionnaire used to analyse the main project risks. The model's outputs are the PD and LGD parameters, used for reporting purposes.

b) Commercial Real Estate

This model assesses the medium and large-sized real estate projects designated for sale and/or letting, carried out by special purpose vehicles as well as by property funds. The model consists of a quantitative module based on a Monte Carlo simulation on the main risk drivers in these types of transactions, where cash flows mainly originating from rent and/or sales are impacted by the trends in historical market data. The model includes a qualitative questionnaire used to complete the analysis of the main project risks. The model's outputs are the PD and LGD parameters, used for reporting purposes.

c) The Real Estate Development (RED) model

This model is used to assess smaller real estate transactions, aimed exclusively at the sale by special purpose vehicles. The model is the result of a series of statistical developments of the instrument, originally created by experts and supported by the available quantitative data.

It consists of a quantitative module containing the figures of the initiative and a qualitative module used to complete the analysis of the main project risks.

d) Asset Finance

This model is used to assess transactions involving the purchase of ships, with a mortgage-type interest over the asset financed, to be leased to a third party that does not belong to the Borrower's group. The model consists of a quantitative module based on a Monte Carlo simulation on the main risk drivers in these types of transactions, where cash flows mainly originating from leasing are impacted by the trends in market data. The model includes a qualitative questionnaire used to analyse the main project risks. The model's outputs are the PD and LGD parameters, used for reporting purposes.

e) Leveraged & Acquisition Finance

This model is used to assess extraordinary finance transactions aimed at corporate acquisitions carried out predominantly with debt capital (high financial leverage); although it does not fall under the regulatory categories of Specialised Lending, it shares the key characteristics of these models. The model consists of a

quantitative modules based on a Monte Carlo simulation of the future cash flows using the prospective economic and financial information following the acquisition. The model includes a qualitative questionnaire deriving from the corporate models, in which the analyst adds additional information in a structured manner. The model's outputs are the PD and LGD parameters, used for reporting purposes.

The Corporate models used by Intesa Sanpaolo Bank Ireland

The INSPIRE bank uses the same Parent Company's Corporate validated models. According to the nature of the business of the Irish subsidiary, most of the exposures are attributable to counterparties measured using the International Large Corporate model.

The Corporate models used by VUB

a) The Internationally Active Large Corporate (IALC) model

The Internationally Active Large Corporate model coincides with the International Large Corporate Model used by the Parent Company, except for a different calibration adopted to the scope of application of the model, which refers to counterparties with turnover under 40 million euro.

The model consists of a quantitative section and a qualitative section, both of which are statistically estimated and integrated with one another according to a matrix-based approach. The manager may override the integrated rating.

b) The Small and Medium Enterprises (SME) model

VUB's SME model, internally estimated by the Slovak subsidiary, is divided into two modules. The first module is statistical in nature and consists of a component relating to the characteristics of the counterparty, such as geographical location, number of employees, age and legal nature, as well as a financial component, differentiated according to the accounting structure (ordinary or simplified accounting schemes). The second model, which considers performance variables, is statistically integrated with the first. The model rating is aligned with the Parent Company's Master Scale.

c) The Specialised Lending models

The models adopted for Specialised Lending are partly derived from the Parent Company, adapting them to the local situation, and produce a slotting class as the output (with the exception of real estate initiatives designated for sale).

Description of the regulatory Retail Mortgages segment internal rating systems (PD)

The internal mortgage rating system is divided into an Acceptance Model, applied upon initial disbursement, and a Performance Model, used for subsequent assessment during the lifetime of the mortgage.

The Acceptance model consists, in turn, of two modules: the personal characteristics module which uses the socio-demographic information of all applicants; and the contractual module which uses the specific information regarding the mortgage agreement. The rating deriving from the integration of the two modules may be modified using notching matrices: by the internal performance indicator of the counterparty's level of risk, if present, and by several indicators of reliability not included in other modules. The rating calculated according to the Acceptance Model remains in effect for the first year of the life of a mortgage, unless there is a deterioration in the internal risk performance. In such cases, the Performance rating enters into effect in advance of usual practice, where worse than the Acceptance rating. From the second year, the Performance rating is always activated and is calculated on a monthly basis with the greatest weighting given to the performance related component provided by the internal performance indicator, which, by definition, is always calculated. The Acceptance rating is still included within the explanatory variables of the Performance model when the mortgage is in its second or third year of life, whereas its weighting is cleared to zero starting from the fourth year.

In the first half of 2013, the Performance model was updated in order to incorporate the latest historical series and the changes to the internal risk performance of the counterparty. Reference is made in particular to the activities of:

- updating of the historical series;
- calculation of new Central Trends (with long-term default rates of the portfolio referring to the period 2008-2012) and consequent recalibration of the models.

VUB Retail Mortgage PD Model

The PD and LGD models for the Slovak residential mortgage market have been developed by the company VUB, in collaboration with the Parent Company as part of the specific Project.

The PD model was updated during 2015, to include a more recent historical series and a wider central trend. It basically consists of two statistical modules. The acceptance module processes the socio-demographic characteristics of customers, such as educational qualification, marital status and home address. The behavioural module integrates, for each of the four retail products (mortgages, personal loans, credit cards and credit facilities), behavioural information regarding operations, non-payment, use of credit lines, duration of relationship with the Bank, etc.

These modules are subsequently integrated statistically with additional information on the customer's risk status. Finally, the model assigns a rating based on an internal scale related to that of the Parent Company.

Description of the regulatory SME Retail segment internal rating systems (PD)

The SME Retail rating models are applied to the entire Small Business Retail population, identified on the basis of two criteria defined at the regulatory level (exposure of the banking group under 1 million euro) and at the Intesa Sanpaolo Group level (with individual or consolidated revenue of under 2.5 million euro). The counterparties are subdivided into Micro Business and Core Business, based on objective criteria envisaged by the process; the definition of default (impairment) used comprises Past Due, Unlikely to pay and Doubtful loans, net of technical defaults.

Both models comprise a quantitative module and a qualitative module.

The former is differentiated based on the variables "existing customer/new customer" (according to the presence of the internal performance indicator on counterparty risk) and legal form (firm or partnership/joint-stock company). In fact, the information used to assess creditworthiness varies depending on the type of customer. A combination of the different basic calculation modules provides the quantitative score.

These basic modules consider personal details, financial statement data for joint-stock companies, the tax return for sole proprietorships and partnerships, risks to the Group and to the credit system and, finally, data on the financial assets of the customer and of joint and related parties, which allow significant refinement in the treatment of new customers and borrowers.

The qualitative module, on the other hand, is based on a qualitative questionnaire. The weights of questions and answers, have been statistically estimated. It also differs in terms of number of questions and weight between the Micro and Core rating model, in order to more accurately grasp the segments specificities.

Furthermore, a specific set of questions has been drawn up for new customers and newly-formed counterparties, with the objective of enhancing the specific soft information known by the manager and their contribution, in terms of experience, to the assessment for this type of counterparty.

A statistically estimated matrix combines and integrates the quantitative rating and the qualitative score. The process for assignment of the Small Business Core rating envisages that, after calculation of the integrated rating, the Manager express an overall assessment of the customer risk under the override procedure, determining the final rating.

The rating assignment process for Micro counterparties, on the other hand, ends by answering an additional question of the Qualitative Questionnaire regarding the presence of any negative information identified at the granting process level, which applies a cap to the final rating in the event of higher risk.

In the first half of 2013, a number of measures were implemented for SME Retail rating models in order to incorporate the most recent historical series. The main adjustments, already applied for the June 2013 report, mainly involved the following:

- updating of the historical series;
- calculation of new Central Trends (with long-term default rates of the portfolio referring to the period 2006-2012) and consequent recalibration of the models;
- revision of the internal Master Scale by updating the PD class.

Description of the LGD model for the Corporate, SME Retail and Mortgage segments

The model for the estimation of the LGD is made up of the following elements:

- estimate of a Doubtful LGD Model: starting from the LGD observed on the portfolio (10-year historical series), or the "workout LGD", determined on the basis of the recoveries and costs, an econometric model of regression of the LGD is estimated on variables considered to be significant for the determination of the loss associated with the Default event; the procedure allows avoidance of the instability of estimates that would result from the use of the cell averages, despite the presence of consistent historical series data, on the relatively unpopulated individual subsets;
- application of a correction factor, known as the Danger Rate is a multiplying correction factor (estimated on a historical series starting from 2008), aimed at recalibrating the Non-Performing LGD with the information available on other default events, in order to produce an LGD that is representative of all the possible default events and their evolution;
- application of other correction factors, known as "Final Settlement Component": this component is
 used as an add-on to the recalibrated estimate of the Danger Rate in order to take account of the loss
 rates associated with positions not evolved to the Doubtful status.

The data from the estimation sample has been subject to normalising: censoring of LGD negative values and treatment at the percentile of LGD values over 100%, filtering of exposures of small amounts and the exclusion of positions with information gaps.

The Incomplete Workout phenomenon is then considered in the estimation model. This phenomenon regards default positions still active at the observation date, but with an age of more than 10 years. For these positions, the residual exposure at the observation date is considered to be completely unrecoverable.

The time factor is taken into consideration by discounting at a risk-free rate all cash movements, recoveries and charges occurring from the time of default to the time of closure (or return to performing status) of the position. The rates are then increased by a spread determined according to the segment, in order to include a premium that takes account of the risk implicit in the volatility of recoveries.

In order to comply with regulatory provisions that require the adjustment of LGD estimates for an economic downturn, and in the absence of a direct relationship between the economic cycle and LGD, it was decided to incorporate this element in the discounting process, by using a suitably stressed risk premium.

As regards the econometric estimation of the Doubtful Loans Model, starting with a long list of variables, using univariate statistical analyses, the short list was defined, based on the contribution of the single variables in the valuation of the loss rate. For the Corporate segment the following bases of analysis were significant: geographical area, presence/absence of personal guarantee, presence/absence of mortgage, type of relationship, and legal form. For the SME Retail segment, the following were significant: geographical area, type of relationship, presence/absence of personal guarantee, presence/absence of mortgage, amount of real estate coverage and exposure level. For the Retail Mortgages segment, the geographical area and amount of real estate coverage were significant. The model applied to the small set of variables involves the use of a multivariate regression, in order to capture the joint capacity of the explanatory variables in the valuation of the loss rate. The outcome of the multivariate model is the estimate of the Non-Performing LGD, determined in relation to the significant bases of analysis. The Danger Rate model and the Final Settlement Corrections are then applied to these results.

Bankruptcy revocatory actions for transactions implemented prior to the bankruptcy date, indicated as "pursuant to Art. 67 of the Bankruptcy Law" and similar articles, are included in the "boundary" category between credit risk and operational risk. Considering the significant dependence on operations of credit risk, as well as the consolidated orientation deriving from comparison with other Italian Groups and Banks, Intesa Sanpaolo decided to include Bankruptcy Revocatory Actions in the area of credit risk. Revocatory actions which are not attributable to credit risk are managed in the area of operational risk.

The LGD models for the Corporate segment of the Leasing and Factoring products

The LGD Corporate models developed for Leasing and Factoring products have the same methodological layout used in the LGD Corporate model of Intesa Sanpaolo's banking products, duly customised in order to take into account the specific characteristics of the two products. The main differences are highlighted below.

For the "Doubtful Loans" model, the length of the historical series used is impacted by restrictions related to the actual availability of data and is based on a 9-year historical series, while the "Danger Rate" model,

which meets the need to represent the structure of the Group for the future, is based on observation of defaults in the most recent periods (observations since 2009 for Leasint and 2010 for Mediofactoring), also due to changes in the non-performing loan management processes of the two product companies, now merged into Mediocredito.

Management of the Incomplete Workout differs from the Parent Company's model in the choice of maximum duration of non-performing status, due to the specific nature of the products, and is 6 years for leasing and 8 years for factoring. The particularly rigorous approach used for leasing has reduced the need to introduce precautionary margins, especially for the real estate sector, characterised by few defaults and limited losses.

The statistical analyses carried out indicate that the bases of analysis that are significant for Leasing are product type (real estate, instrumental, naval-aviation and railway, and motor vehicles) and the regulatory segment (Corporate and SME Corporate). The following were significant for Factoring: product type (with recourse, without recourse), geographical area (Italy, Foreign) and regulatory segment (Corporate, SME Corporate).

LGD model for the VUB mortgage segment

The LGD model was developed based on a "workout" approach, analysing the losses sustained by the Bank on the historical defaults. LGD is therefore determined based on the recovery rates achieved during the default period, taking into consideration direct and indirect costs and recovery times. Assessment of the loss rates was carried out for each individual transaction. The model classifies the data into two groups, according to two risk factors: LTV (residual debt at default over the value of the guarantee provided) and PPI (purchasing power index of the geographical area in which the collateral is situated).

Quantitative disclosure

The table below shows the scope of companies for which the Group, as at 31 December 2015, uses the IRB approaches in calculating the capital requirements for credit and counterparty risk for the "Corporate" (Foundation and Advanced IRB), "Residential mortgages to private individuals" (IRB²) and "SME retail" (IRB) regulatory segments.

Scope of companies for application of the IRB approaches

Company	Corporate FIRB	Corporate AIRB LGD	SME Retail IRB LGD	Mortgage IRB LGD
Intesa Sanpaolo Banco di Napoli Cassa di Risparmio del Veneto Cassa di Risparmio in Bologna Cassa di Risparmio del Friuli Venezia Giulia	Dec - 2008	Dec - 2010	Dec - 2012	Jun - 2010
Cassa dei Risparmi di Forlì e della Romagna Banca dell'Adriatico Mediocredito Italiano				n.a.
Gruppo Cassa di Risparmio di Firenze	Dec - 2009	Dec - 2010	Dec - 2012	Jun - 2010
Cassa di Risparmio dell'Umbria	n.a.	Dec - 2010	Dec - 2012	Dec - 2011
Banca Prossima	n.a.	Dec - 2013	Dec - 2013	n.a.
Banca IMI	n.a.	Jun - 2012	n.a.	n.a.
ntesa Sanpaolo Bank Ireland	Mar - 2010	Dec - 2011	n.a.	n.a.
Vseobecna Uverova Banka	Dec - 2010	Jun - 2014	Jun - 2014	Jun - 2012

Changes compared to the situation as at 31 December 2014 include the mergers by incorporation of Banca di Trento e Bolzano, Banca Monte Parma, Cassa di Risparmio di Rieti, Cassa di Risparmio della Provincia di Viterbo and Cassa di Risparmio di Civitavecchia (CRF Group) into the Parent Company Intesa Sanpaolo S.p.A.

The exposure values as at 31 December 2015 for the various IRB approaches (IRB, Foundation IRB and Advanced IRB) are shown in the tables below.

Exposure values by regulatory portfolio (Foundation IRB Approach)

Regulatory portfolio	Exposure value			
	31.12.2015	31.12.2014		
Exposures to or secured by corporates:				
- Specialised lending	-	-		
- SMEs (Small and Medium Enterprises)	178	145		
- Other corporates	849	<i>7</i> 95		
Total credit risk (IRB)	1,027	940		

² Given that the rating systems for retail exposures must reflect both the borrower risk and the specific risk of the transaction, in this case there is no distinction between the Foundation and the Advanced IRB approach.

Exposure values by regulatory portfolio (Advanced IRB Approach)

(millions of euro)

Regulatory portfolio	Exposure value			
	31.12.2015	31.12.2014		
Exposures to or secured by corporates:				
- Specialised lending	16,207	16,563		
- SMEs (Small and Medium Enterprises)	69,806	72,531		
- Other corporates	115,830	110,822		
Total credit risk (Advanced IRB approach)	201,843	199,916		

Exposure values by regulatory portfolio (IRB Approach)

(millions of euro)

Regulatory portfolio	Exposure value			
	31.12.2015	31.12.2014		
Retail exposures:				
- Exposures secured by residential property: SMEs	5,965	6,341		
- Exposures secured by residential property: private individuals	62,836	63,764		
- Other retail exposures: SMEs	15,252	15,490		
Total credit risk (IRB)	84,053	85,595		

Values of exposures to securitisations (IRB Approach)

(millions of euro)

Securitizations	Expos	Exposure value	
	31.12.2015	31.12.2014	
Exposures to securitisations (RBA)	2,589	2,246	
Total credit risk (IRB)	2,589	2,246	

For detailed information on exposures to securitisations, see the specific section.

The exposure value shown in the tables set forth in this Section is expressed gross of adjustments and takes into account (for guarantees given and commitments to disburse funds) credit conversion factors. Conversely, the exposure value does not consider the techniques for mitigation of risk which – for exposures assessed using internal models – are directly incorporated in the weightings applied to said exposure.

Below is a breakdown by geographical area of the exposure subject to IRB approaches broken down by major countries for which the exposures cumulated on both portfolios exceed the 2 billion threshold and which represent, overall, approximately 95% of the Group's total IRB exposures.

B.2) Exchange-traded equity exposures	160	200		
B.3) Other equity exposures	542	527		
C. Equity exposures: Exposures subject to fixed weighting factors	640	631		
Total Specialised lending and equity exposures subject to the IRB approaches	2,236	2,362		

The weighted values of the equities subject to the IRB approaches and the weighted values of the equity instruments subject to the Standardised approach are detailed in Table 13 "Equity exposures: disclosures for positions not included in the trading book".

Actual losses and comparison with expected losses

The table below shows the actual losses recognised in the income statement during the last three years on the counterparties in default belonging to the regulatory portfolios for which the Group applies internal methods to calculate the capital requirements for credit risk.

Actual losses by regulatory portfolio

(millions of euro)

Regulatory portfolio	Actual losses			
	2015	2014	2013	
Exposures to or secured by corporates (Corporate)	-2,183	-3,111	-4,881	
Exposures secured by residential property (Retail mortgages)	-136	-129	-176	
Exposures to SMEs (SME retail)	-192	-352	-410	

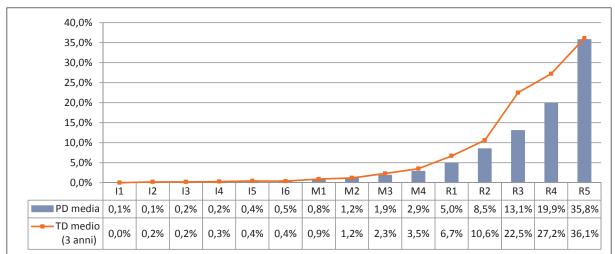

During the 2013-2015 period, expected losses for performing Corporate counterparties (determined based on prior year-end data) amounted to a total of 4,165 million euro. The actual losses recorded during the same period, presented in the foregoing table, significantly exceeded the expected losses, due to deterioration of the economic context in the final part of 2011, which resulted in both a transfer to non-performing loans greater than the ex-ante PD, as presented in the paragraph below concerning backtesting of ratings, and a deterioration in prospects for the recovery of non-performing loans. While recording lower adjustments in 2015, it should be noted that in the last three years, there was an increase in negative trends within the non-performing loans category: transfers to the non-performing category increased, while those to the performing category decreased. It was also necessary to make significant adjustments to existing non-performing positions that worsened following the crisis in the financial markets and in the real estate sector and, then, the recession that hit most of the countries where the Group operates, primarily Italy. The total amount of actual losses over the last three years, therefore, was significantly impacted by the losses sustained on non-performing loans in prior periods, not included in the expected losses calculated for the performing portfolio at the beginning of the year.

Expected losses in 2013-2015 for residential mortgages amounted to a total of 419 million euro, slightly below the actual loss figure indicated above.

Finally, the PMI Retail asset class shows an expected loss of 585 million euro which, as already recorded for the Corporate area, is significantly below the actual losses.

Comparison of PD and DR figures by rating class for the Corporate regulatory segment

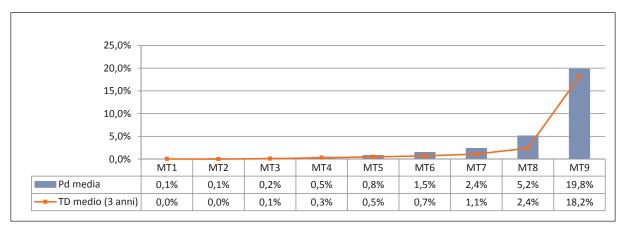

As part of its ongoing validation work, Internal Validation periodically (on a half-yearly basis) compared the default rates recorded on the models validated for IRB purposes with the average PDs by individual rating class. The following table presents a breakdown of PD and default figures for the Domestic corporate regulatory segment by rating class.

The default rate, calculated as an average for the years 2013-2014-2015, shows a monotonic increase as the rating class worsens. The riskier classes show an increase in DR and consequent exceeding of the relative PD. The underestimation of the DRs in periods of recession is due to the fact that the rating models provide, in accordance with the regulations, a "through the cycle" risk assessment; in line with

this assumption, it is hereby specified that with regards to 2015, which shows the first signs of economic recovery, the DRs have decreased reducing significantly the gap with PDs. The performance of the model in terms of discriminating power is fully satisfactory. Accuracy ratio levels fall between 64% and 82% by turnover bracket and combination of turnover bracket/geographical area.

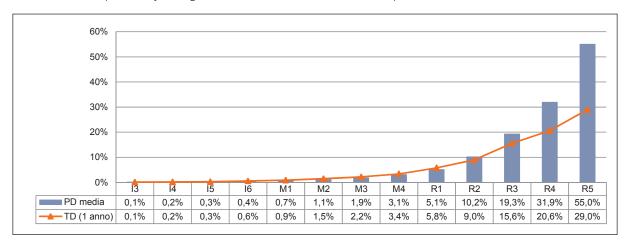

The same distribution by rating class as shown for the Performance portfolio is presented for the model for residential mortgages for private individuals. The scope also includes performing mortgage relationships within IRB validated scope and with valid Performance rating.

There is a monotonic increase in the default rate as the rating class worsens. The class PDs are in line with the default rates observed for the classes from MT1 to MT4, higher for classes from MT5 to MT9.

At 75%, the discriminating power of the Residential Mortgages for Private Individuals model is also above the acceptance threshold.

For the assessment of the counterparties in the SME Retail segment, the same distribution of PD and default rate is reported by rating class referred to the IRB validated portfolio.

The default rates appear to be generally in line with the theoretical PDs in the I band, slightly higher in the M band and generally lower in the R band, with the exception of R1, and feature a substantially monotonic trend that increases along the rating classes. The performance of the models in terms of discriminating power is overall satisfactory. Accuracy ratio levels fall between 54% and 69% by customer type and the duration of the relationship with the Bank.

Section 8 - Credit risk mitigation techniques

Qualitative disclosure

Policies and processes for, and indication of the extent to which the Bank makes use of, on- and off-balance sheet netting.

The Group entered into (bilateral) netting agreements that, in the event of default of the counterparty, enable the netting off of mutual claims and obligations in relation to transactions in financial instruments and credit derivatives, as well as securities financing transactions (SFTs).

This takes place through the signature of ISDA agreements (for transactions in derivatives) and GMRA and OSLA/GMSLA agreements (for repurchase agreements and securities lending respectively). Both of these protocols enable the management and mitigation of credit risk. In compliance with the conditions laid down by the Supervisory regulations, these agreements permit the reduction of the absorption of regulatory capital.

The Group also establishes margin agreements to cover transactions in OTC derivatives and SFTs (respectively the Credit Support Annex and Global Master Repurchase Agreement/OSLA/GMSLA). Moreover, the group uses the clearing services provided by LCH Clearnet for the Swapclear derivatives segment. This is a clearing service for the most standard types of over the counter derivative contracts (plain vanilla interest rate derivatives). The individual transactions, previously concluded between the subscribers to the service, are subsequently transferred to the clearing house, which, in the same way as for listed derivatives, becomes the counterparty for the original contracting parties. LCH Clearnet provides for the settlement of the daily variation margin on the individual transactions, so that the mutual claims and obligations are automatically netted off against each other.

In addition to the reduction of operational risk (through the daily netting off of all the cash flows and the precise control of the transactions), SwapClear offers the typical advantages of centralised netting and collateralisation agreements. Also, the Group's subscription to the CLS – Continuous Linked Settlement circuit, and to the corresponding settlement services on a payment-versus-payment basis has enabled the mitigation of the settlement risk at the time of mutual payments with counterparties.

For more detailed information, reference should be made to the quantitative disclosure indicated in the Section on Counterparty risk of this document.

Policies and processes for collateral evaluation and management

The granting of credit with the acquisition of collateral is subject to internal rules and processes – for the evaluation of the asset, the acceptance of the guarantee and the control of its value – differentiated according to pledged and mortgage collateral. The enforcement of the guarantee is handled by specialist departments, which are responsible for credit recovery. In any case, the presence of collateral does not grant exemption from a complete assessment of the credit risk, mainly concentrated on the borrower's ability to meet the obligations assumed, irrespective of the associated guarantee. Under certain conditions (type of counterparty, rating assigned, type of contract), the collateral has an impact, as a mitigating factor, on the determination of the approval limits. Mitigating factors are defined based on elements that contribute to reducing the potential losses for the Bank in the case of default of the counterparty. For operational purposes, the extent of the mitigating factors is determined based on a series of factors. Among these, the Loss Given Default (LGD) is of major importance. This is expressed by a percentage, which is higher in the case of non-guaranteed interventions and lower, on the contrary, in the presence of elements mitigating credit risk.

Guarantees received are included in the calculation of the Loss Given Default, based on (i) the initial value; (ii) the strength of said value over time; and (iii) the ease of realisation.

The guarantees received with the highest impact include:

- pledges on financial assets, differentiated based on the underlying (cash, OECD government bonds, financial instruments issued by the Bank, shares and bonds quoted on regulated markets, mutual funds, etc.);
- mortgages on real estate, separated based on the use of the asset (residential, industrial property, agricultural funds/properties, commercial, industrial properties, etc.);

provided that:

- they are provided without any time limits or, if the collateral has an expiry date, this is not before the expiry of the loan guaranteed;
- they are acquired in a form that is enforceable against third parties and in accordance with the procedures established by the regulations prevailing at the time.

During the credit granting phase, the assessment of the pledged collateral is based on the actual value, namely the market value for financial instruments listed in a regulated market, or, otherwise, the estimated realisable value. The resulting value is multiplied by the haircut percentage rates, differentiated according to the financial instruments or set of financial instruments accepted as collateral.

In order to limit the risks of absence or termination of the protection, specific safeguards are in place, including: restoration of the collateral in the presence of a reduction of the initial value of the assets and the extension of the pledge to include sums from the redemption of the financial instruments.

With regard to real estate collateral, separate processes and methods are aimed at ensuring the proper assessment and monitoring of the value of the properties accepted as collateral.

Assets are evaluated, prior to the decision to grant the credit, using both internal and external technicians. The external technicians are included in a special list of professionals accredited on the basis of an individual verification of their capabilities and experience and the characteristics of absolute professional independence. The valuation of residential properties used as collateral for mortgage loans to private individuals is mainly assigned to specialised companies. The work of the experts is monitored on an ongoing basis, by means of statistical verifications and spot checks carried out centrally.

The experts' duties are scaled on the basis of both the amount of the transaction and the property types. A system is also in place for the review by the central functions of the expert surveys for large-scale transactions.

The technicians are required to produce estimates on the basis of standardised expert technical reports, differentiated according to the valuation method to be applied and the building category of the asset offered as collateral.

In order to ensure that the valuation criteria and approaches are uniform, a property valuation code ("Property Valuation rules for credit purposes") is in force, which ensures the comparability of the estimates, and guarantees that the value of the property is calculated clearly and transparently on a prudential basis. The content of the internal code is consistent with the "Guidelines for the valuation of properties securing credit exposures" promoted by the Italian Banking Association and with the "European Valuation Standards" (EVS2012).

Property valuations are managed through a specific integrated platform (the Appraisals Portal) covering the entire technical analysis phase, ensuring that assignments are properly awarded, on an independent basis and according to objective criteria, the workflow is thoroughly monitored, valuation standards are correctly applied and all information and documents regarding real estate are kept.

During the credit granting phase, the valuation of the properties is based on the prudential market value or, for properties under construction, on the construction cost. The resulting value is multiplied by the haircut percentages, differentiated on the basis of the property's designated use.

The value of the real estate collateral is updated on a monthly basis by using the prices/coefficients acquired from an external supplier offering proven skills and a solid reputation for surveying and measuring the market prices of Italian real-estate assets.

The revaluation takes place by adopting four main methods:

- Survey value index method
 - the method uses indexes of revaluation of the prices of the real estate to be applied to the survey value of the property in question. It is the main revaluation method, adopted when the survey value is considered reliable through specific tests.
- Comparables method
 - the method assumes market values per square metre and applies them on the basis of the size (in square meters) of the property. The method is used when the survey value is not considered to be reliable. It is also used as "backtesting" implied in the survey value.

- Financing value index method
 the method applies the price revaluation indexes to 125% of the original value of the financing (thus
 it is prudentially assumed that the financing was originally disbursed with the maximum LtV of 80%).
 The method is applied in the presence of subdivisions or if the survey value is not reliable and it is
 impossible to apply the comparables.
- Cost method
 in case of properties under construction, market practices suggest a valuation based on the estimate
 of the overall costs incurred in correspondence with the work progress made on the property in
 question.

The value of properties under construction is monitored on an ongoing basis by experts who perform inspections, verify the progress of the works and prepare technical reports for loan disbursement.

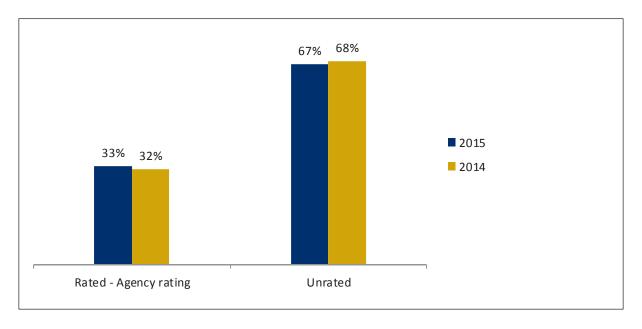

The valuation is duly updated in the event of limitation or splitting of the mortgage, of damage to the property, significant impairment losses reported by market indicators used to monitor fair value and, in any case, every three years for major exposures.

To cover the residual risks, the borrower is required to provide an insurance policy against damage. The insurable value is determined by a survey, on the basis of the property's reconstruction cost new.

The main types of guarantor and credit derivative counterparty and their creditworthiness

With regard to transactions on credit derivatives, figures as at December 2015 show a significant reduction in EAD compared to December 2014 but a substantial stability in the distribution of the rated and unrated component.

Creditworthiness of the counterparties in credit derivative transactions

Information about market or credit risk concentrations under the credit risk mitigation instruments used

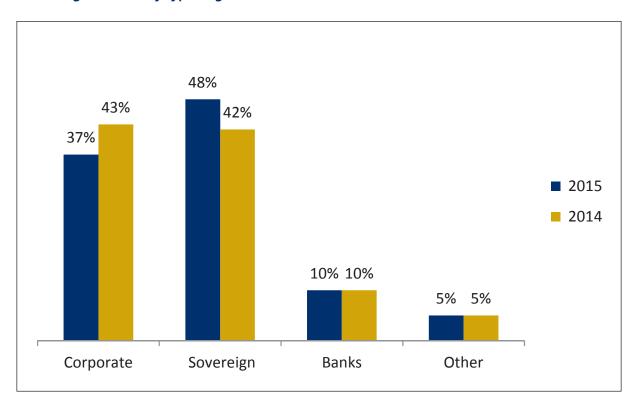

Personal guarantees

Personal guarantees, as noted in the quantitative disclosure, cover a limited amount of the overall credit exposure.

The share associated with Corporate guarantors accounts for 37% of the total amount. Sovereign guarantors (primarily the Italian government) and banks (such as Crédit Agricole SA and Mediobanca) account for 48% and 10%, respectively.

There were other no material concentrations of guarantors.

Personal guarantees by type of guarantor

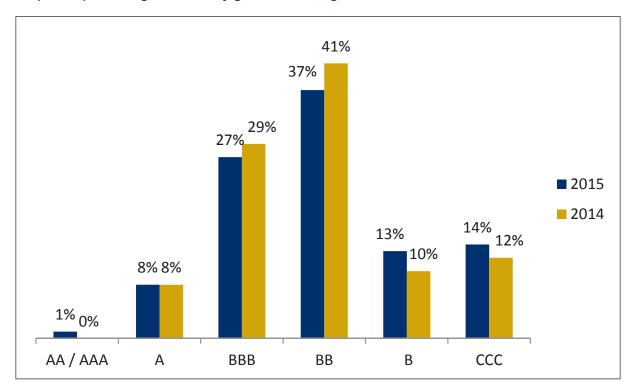

Personal guarantees by guarantor rating classes

By type of personal guarantee, guarantors show a high credit quality, with 73% investment grade (69% in December 2014)

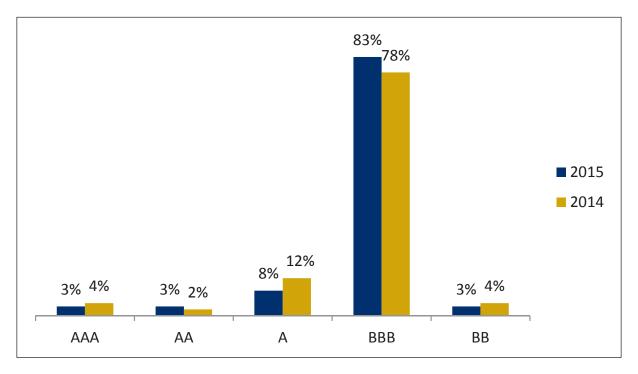

The distribution by rating classes shows that Corporate guarantors and guarantors belonging to other segments classified as investment grade have shares of approximately 36% and 97%, respectively (37% and 95% in December 2014). The former are assigned ratings using the internal model, and the latter are assigned ratings by Agencies.

With regard to other non-corporate segment personal guarantees, there was an increase in the BBB rating class (78% in December 2014) attributable mainly to the increase in the exposure guaranteed by the Italian Government.

Corporate personal guarantees by guarantor rating classes

Other non-corporate segment personal guarantees by guarantor rating classes

Financial collateral

The majority (around 93%) of the financial collateral eligible for risk mitigation relates to repurchase agreements. The main issuers in addition to the sovereign state feature ratings in the high investment grade area. As regards the potential exposure to market risk, it should be noted that 69% of these securities have a maturity of less than 5 years (67% as at December 2014). The remaining 7% of financial collateral relates to pledges on bonds, cash deposits and funds.

Other collateral

Other collateral consists almost entirely of mortgages on real estate assets. Although there are no particular concentrations, for example in individual assets or particular geographical areas, the major amount of mortgage lending is in the Bank's exposure to a systematic risk factor represented by the prices of the real estate assets. This exposure, which is naturally inherent to lending operations, is quantified by means of appropriate scenario and stress analyses within the ICAAP process.

Quantitative disclosure

As required by the specific regulations, this Section lists only the portions of exposures secured by financial collateral and personal guarantees subject to the calculation of capital requirements using the standard and foundation IRB approaches. The column "Personal guarantees or credit derivatives" consists almost exclusively of guarantees received in the form of personal guarantees, as credit derivatives represent an insignificant proportion of the total guarantees of the Intesa Sanpaolo Group.

Breakdown of exposures secured by collateral, guarantees or credit derivatives by exposure class

Secured exposures subject to the Standardised approach

(millions of euro)

Regulatory portfolio	31.12	2.2015	31.12.2014		
	Collateral	Personal guarantees or credit derivatives	Collateral	Personal guarantees or credit derivatives	
Exposures to or secured by governments and central banks	7	6,453	1	5,404	
Exposures to or secured by regional or local authorities	-	462	-	425	
Exposures to or secured by public sector organisations	2	13	5	14	
Exposures to or secured by multilateral development banks	-	6	-	3	
Exposures to or secured by international organisations	-	-	-	-	
Exposures to or secured by supervised institutions	48,153	971	38,237	885	
Exposures to or secured by corporates and other entities	6,387	84	6,100	93	
Retail exposures	1,419	-	1,520	-	
Exposures secured by real estate	-	-	1	-	
Defaulted exposures	120	-	121	-	
High-risk exposures	-	-	-	-	
Exposures in the form of covered bonds	-	-	-	-	
Short-term exposures to corporates and other entities or supervised institutions	-	-	-	-	
Exposures to UCI	188	-	169	-	
Other exposures	-	-	-	-	
Securitisations	-	-	-	-	
Total	56,276	7,989	46,154	6,824	

The table above complements the disclosures in the Section on credit risks - standardised approach, in the sub-table "exposures with credit risk mitigation", which shows the residual exposure not covered by these guarantees. Under the current regulations, when the comprehensive method is adopted (as Intesa Sanpaolo does in the majority of cases), collateral (e.g. cash collateral or securities received as pledges) reduces risk exposure, whereas personal guarantees (and the remaining collateral - simplified method) transfer the related risk to the guarantor's regulatory portfolio; consequently, the representation of personal guarantees included in this Section is the guarantor's responsibility.

Exposures secured by mortgage collateral, for which the regulations require the assignment of preferential weightings, are not shown in this Table, as they are already included under "exposures secured by real estate property". Collaterals on transactions secured by real estate property refer to marginal additional collaterals received on these types of transactions.

Secured exposures subject to the foundation IRB approach

(millions of euro) Regulatory portfolio 31.12.2015 31.12.2014 Collateral Personal Collateral Personal guarantees guarantees or credit or credit derivatives derivatives Exposures to or secured by corporates Specialised lending 7 **SMEs** 10 Other corporates 3 Specialised lending - slotting criteria 13

The secured exposures subject to the foundation IRB approach solely regard VUB Banka, the only company of the Group that still uses the foundation IRB approach after migration by the Group's other companies to the advanced approaches (AIRB).

Exposures secured by mortgage collateral for private individuals or retail, for which the Group applies the IRB approach (other than the foundation IRB approach), are not included in this Section inasmuch as they are specifically indicated in the Section on ther use of the IRB appraches.

Section 9 – Counterparty risk

Qualitative disclosure

Counterparty risk, in accordance with the Regulatory provisions, is a specific type of credit risk and represents the risk of a counterparty in a transaction defaulting before the final settlement of the cash flows involved in the transaction. The regulations lay down specific rules for the quantification of the amount of the exposures while referring to those governing credit risk for the determination of risk weightings.

In accordance with these regulations, counterparty risk is calculated for the following categories of transactions:

- over-the-counter (OTC) financial and credit derivatives;
- Securities Financial Transactions SFTs (e.g. repurchase agreements);
- transactions with medium to long-term settlement.

The framework provides for the uniform treatment of counterparty risk regardless of the portfolio in which the exposures have been classified (the banking and regulatory trading books are both subject to capital requirements for counterparty risk). For the purposes of reducing the amount of the exposures, recognition of various types of contractual netting arrangements ("Master netting agreements") is permitted, subject to compliance with statutory requirements.

Starting from the report as at March 2014, having received authorisation from the Supervisory Authority, Banca IMI and the Parent Company have adopted the Internal Models approach, for regulatory reporting purposes for the counterparty requirement for OTC and ETD contracts; the remaining group companies continue to report the requirement for counterparty risk using the standard method, but the authorization process is underway at the Supervisory Authority for Banks belonging to the Banca dei Territori Division and for the extension of the scope of the internal model to SFT instruments.

The internal model is applied in accordance with the Basel 3 instructions, so the requirement for counterparty risk is calculated as the sum of the default risk and the CVA risk. The risk of default is determined starting from a EAD that is the maximum between the EAD calculated according to the current risk parameters and that calculated according to risk parameters based on a stress period.

The CVA Capital Charge is calculated as the sum between the CVA VaR calculated on the movements in credit spreads of counterparties registered in the last year and that calculated on the movements during a stress period that has currently been identified as the 2011-2012 period.

Potential exposure (estimated with the actual average PFE) has been adopted by Banca IMI, the Parent Company and the banks in the Banca dei Territori Division for the purposes of operational measurement of uses of credit lines for replacement risk, for OTC, ETD and SFT.

For the rest of the Group, the definition of the use of credit lines for transactions in OTC derivatives involves the application of the greater of the mark-to-market and the add-on to determine the credit exposure, taking into account any existing netting and collateral agreements.

Add-ons indicate the maximum potential future exposure (95th percentile), regularly estimated by the Financial and Market Risks Department - DRFM, by product type and maturity. The loan facility for OTC transactions is defined on the same basis as the on-balance sheet exposures, in consideration of the specific elements of the OTC derivative transactions, and transactions for which the exposure may change over time as the underlying risk factors change. PFE measurements are calculated daily by the DRFM, analysed and sent to the monitoring systems for the lines of credit for OTC and SFT derivatives. The DRFM also provides a daily report on the positions with a use above 70%, to support the facility monitoring activities, with indication of the financial analysis underlying the change of the PFE measurement over time. For entities or instruments outside the scope of application of PFE, the grid for the operational addons forms part of the monitoring systems for the lines of credit for OTC and SFT derivatives that apply the calculation algorithm on a daily basis to quantify the credit exposure to a particular counterparty.

The Group makes extensive use of netting and cash collateral agreements to substantially mitigate the exposure to counterparties, particularly towards banks and financial institutions.

In order for risk to be managed effectively within the Bank, the risk measurement system must be integrated into decision-making processes and the management of company operations. To that end, in

accordance with the "use test" requirement of Basel 3, the Group has adopted an operating model aimed at obtaining the estimate, also for regulatory purposes, of the statistical measures that enable the analysis of the evolution of the risk of the derivatives over time. Particular attention was dedicated to the update of the management regulatory framework with regard to the eligibility of collaterals for trading in Security Financing Transactions.

The organisational functions involved, as described in the Bank's internal regulations, are:

- DRFM, which is responsible for the counterparty risk measurement system by defining calculation methods, producing and analysing measures of exposure;
- the Level I and Level II control functions that use the measurements produced to monitor the assumed positions;
- the marketing and credit functions that draw on the foregoing measures as part of the granting process to determine the limits of the lines of credit.

The following company processes were implemented to complete the risk analysis process for the exposure measures implemented over time following the developments discussed above, for the Parent Company and Banca IMI:

- definition and periodic calculation of stress tests on market scenarios and joint market/credit scenarios on counterparty risk measures;
- definition and periodic analysis of Wrong-Way Risk, i.e. the risk of a positive correlation between the future exposure to a counterparty and that counterparty's probability of default;
- definition and monitoring of management limits at the portfolio level authorised by the Group Financial Risks Committee for OTC derivatives transactions;
- contribution of collateral inflow/outflow risk measures, calculated on the basis of the internal counterparty risk model, for OTC derivatives transactions with collateral agreements (CSA);
- backtesting: Basel 3 requires to produce backtesting analyses in order to test the appropriateness of the model. Tests are carried out on risk factors, financial instrument and netting set;
- reporting to the management of measures calculated using the internal exposure model, capital requirement, level of use of management limits, results of stress tests and analyses of wrong-way risk.

The backtesting program, defined on the basis of Basel 3 requirements provides for the maintenance of historical series of forecasts obtained from the calculation model and its results on:

- risk factors
- financial instruments
- netting set

Through statistical analysis, supported by qualitative analyses for the forecasting horizons for which it is not possible to accumulate sufficient observations, the predictive ability of the model is measured. An internal policy was defined to enable corrective procedures in case the model shows significant limitations in the representation of the underlying risks or the changed market conditions require and adjustment thereof.

The backtesting results are reported in the quarterly disclosure to the Supervisory Authority.

The Parent Company Intesa Sanpaolo and Banca IMI have adopted a programme of stress tests on the counterparty risk with the objective of assessing the effects connected with the occurrence of extreme scenarios relating to market and credit factors that influence counterparty risk exposures.

The stress tests allow the estimate of potential sudden liquidity needs of the Bank with regard to the collateralised exposures, due to extreme movements of the risk factors underlying transactions in OTC derivatives.

The stress test programme allows the identification of market scenarios the Bank is mostly exposed to and represents a risk analysis tool that complements the management and regulatory metrics.

The stress test programme is based on the application of mono-factor and multi-factor scenarios to the "reference set", which is the set of market data used for the pricing of the financial instruments present within the scope of the internal model. Analysed in addition to the stress on the market risk factors is the effect of the deterioration of the creditworthiness of the counterparty through the joint stress on market and credit variables (PD, LGD).

The generic wrong way risk (WWR) arises when there is positive correlation between the probability of default of a counterparty and the general market risk factors.

A methodology is followed to identify the generic WWR, which uses the results from the stress tests conducted as part of the stress testing programme for the counterparty risk, focusing on the counterparties whose credit spread is more historically correlated to the risk factors identified by the stress tests.

The reports and the analysis of the results are aimed at highlighting the most significant effects at portfolio level, of segments of counterparties or individual counterparties.

The specific Wrong Way Risk arises in case of positive correlation between the future exposure towards a counterparty and the probability of its default due to the nature of the transactions with this counterparty, or in case of a legal connection between the counterparty and the issuer of the derivative's underlying.

A methodology is followed to identify the specific WWR without legal connection, which is based on the analysis of the relation between the Mark To Market forecasts of the portfolio of a counterparty and the credit spread forecasts of the same counterparty, in the various scenarios of the EPE model, at a certain future time-step.

As part of the specific WWR with legal connection, an organisation process has been defined in order to identify, report, authorise, and monitor in a specific manner the transactions with such risk, also for the purposes of the depreciative treatment established by the regulations in terms of capital requirement.

In order to consistently represent and monitor the overall risk profile in terms of counterparty risk generated by transactions in OTC derivative instruments, the Group Financial Risks Committee has resolved a system of specific limits defined at Legal Entity level, monitored by the Financial and Market Risk Department (DRFM), for the Intesa Sanpaolo Parent Company and Banca IMI, comprising:

- a regulatory capital limit, calculated with the internal model on the counterparty risk, with the formulas set by the Basel 3 requirements;
- a CP VaR limit that measures the exposure to the default risk of the counterparties of OTC derivative transactions, calculated with internal metrics in terms of unexpected loss over a time period of one year;
- a CVA VaR limit that measures the exposure to the risk of increase in the credit spreads of the counterparties of the OTC derivative transactions, calculated in terms of daily VaR.

These limits allow a synthetic and homogenous control of the levels of risk exposure for transactions in OTC derivatives of the portfolios of Intesa Sanpaolo and Banca IMI. Adopting such indicators also results in the consolidation, through a process of subsequent aggregations, of the exposure to different types of risk in the individual activity segments (for both collateralised and non-collateralised counterparties) to obtain the measurement of the overall exposure at Legal Entity, Region, Industry and counterparty level.

The internal counterparty risk model allows the estimate of the liquidity requirement deriving from collateralised OTC derivative instruments (in terms of inflow and outflow of collateral), by predicting the expected variation of the Mark To Market. These measures are aimed at feeding the system of the DRFM that measures the liquidity risk (Liquidity Risk System), while guaranteeing the information details needed to develop the various measurement metrics currently set for internal purposes (Liquidity Policy) and for the weekly liquidity report to the Supervisory Authority, and are also the subject of the programme of stress tests on the counterparty risk.

The determination of fair value considers not only market factors and the nature of the contract (maturity, type of contract, etc.), but also own credit quality and that of the counterparty in relation to the current and potential exposure. Compared to the adjustment of the mark to market through the calculation of the Credit Risk Adjustment (CRA) already in use, the introduction of the accounting standard IFRS13 included the calculation of the own credit risk in valuing the Fair Value, to include the non-performance risk inclusive of the issuer's risk in the valuation of OTC derivatives.

In order to comply with the new standard, a new calculation model was developed – the Bilateral Credit Value Adjustment (bCVA) – which in addition to the effects of changes in the counterparty credit rating (the first subject of the credit risk adjustment methodology) also takes fully into account the changes in own credit rating (Debt Value Adjustment - DVA) and identifies a series of refinements to the previous methodology. The bCVA has two addends, calculated by considering the possibility that both counterparties go bankrupt, known as the Credit Value Adjustment (CVA) and Debt Value Adjustment (DVA):

 the CVA (negative) takes into account scenarios whereby the Counterparty fails before the Bank and the Bank has a positive exposure to the Counterparty. In these scenarios the Bank suffers a loss equal to the cost of replacing the derivative; the DVA (positive) takes into account scenarios whereby the Bank fails before the Counterparty and
has a negative exposure to the Counterparty. In these scenarios the Bank achieves a gain equal to the
cost of replacing the derivative.

Compared to the calculation of the CRA, the bCVA model identifies a series of refinements of the preexisting CRA methodology, including the calculation of the risk exposure valued by incorporating the average of the future exposures (positive/negative Expected Positive/Negative Exposure).

The prior Credit Risk Adjustment (CRA) calculation model is still valid for a number of products for which the bCVA model is still under development.

Quantitative disclosure

The table below shows the overall EAD of exposures in financial and credit derivatives and SFT transactions, broken down by measurement approach (EPE internal models or mark-to-market approach).

Counterparty risk

(millions of euro)

Transaction categories	Exposure ad default (EAD)				
	31.12.20)15	31.12.2014		
	Current Exposure	EPE Internal	Current Exposure	EPE Internal	
	Method	Method	Method	Method	
Derivative contracts SFT transactions (Securities Financing Transaction) and long settlement transactions	1,325	16,412	1,424	17,093	
	59,151	-	48,473	-	

The exposure value shown in the table above, refers to both positions in the regulatory trading book and the banking book.

As already mentioned, starting from April 2014, valid for the March 2014 reporting, Banca IMI and the Parent Company were authorised to use EPE (Expected Positive Exposure) internal models to determine the requirement for counterparty risk. This approach is applicable to almost the entire trading portfolio (as shown in the table, as at 31 December 2015 approximately 93% of the total EAD of financial and credit derivatives is measured using EPE models). At consolidated level, derivatives whose counterparty risk is measured using approaches other than internal models represent a residual portion of the portfolio (as at 31 December 2015 accounting for approximately 7% of overall EAD) and refer to:

- residual contracts of Banca IMI and Intesa Sanpaolo to which EPE is not applied (in compliance with the insignificance of the EBA thresholds);
- EAD generated by all other banks and companies in the group which report using the mark-to-market approach.

For the banks in the Banca dei Territori division, the activities are underway to extend the internal model. The EPE internal model considers the collateral collected to mitigate credit exposure and any excess collateral paid. The value of guarantees received and included in the calculation of the EAD amounted to over 3.6 billion euro for Banca IMI and the Parent Company, while the collateral paid amounted to 7.7 billion euro.

With regards to reverse repurchase agreements, the Group considers the guarantee in securities as financial collateral, directly reducing the value of the exposure ("comprehensive" method). For repurchase agreements, the cash received is considered as financial collateral.

In addition to what already reported above for the EPE approach, the exposures in the table above benefited from risk mitigation (collateral) for a total of 53,552 million euro, mainly referring to SFTs (44,439 as at 31 December 2014).

The capital requirement for "counterparty risk", for both the regulatory trading book and the banking book, is shown - for the individual regulatory portfolios - in the tables of the capital requirements for credit risk treated under the standardised approach and the IRB approach.

Financial derivatives - Regulatory trading book: period-end notional amounts

The table above shows the financial derivatives recognised in the financial statements in the trading book, but not forming part of the regulatory trading book. In particular, the table shows the derivatives recorded separately from the combined financial instruments, the derivatives used to hedge debt securities measured at fair value through profit and loss, operational foreign exchange risk hedging derivatives correlated to specific foreign-currency funding and the put and call options relating to commitments on equity investments.

Application of the amendments to IFRS 7 regarding the disclosure of netting arrangements became mandatory starting from 1 January 2013.

According to these amendments, IFRS 7 requires specific disclosure for financial instruments that have been offset in the Balance Sheet pursuant to IAS 32 or that may be potentially offset, upon occurrence of specific conditions, but are recognised in the Balance Sheet without any netting since they are regulated by "netting framework arrangements or similar" that do not respect all of the criteria set forth by IAS 32, paragraph 42.

In this respect, the Intesa Sanpaolo Group has netting arrangements that meet the requirements envisaged by IAS 32.42 for offsetting in the financial statements. In particular, these are arrangements that regulate the clearing of Over the Counter derivatives through subscription to the SwapClear service (LCH Group). This circuit, replacing the original counterparties of the OTC derivatives, mitigates credit risk by calling daily margins on all positions transferred, so that the mutual credit and debt positions are automatically offset. In the table below, therefore, the column regarding the amount of financial assets/liabilities offset in the balance sheet represents the negative fair values on interest rate derivatives offset with the positive fair values for representation in the financial statements. The information is mirrored in the following table.

In terms of instruments that may be potentially offset upon occurrence of such events, it is noted that the Group uses bilateral netting arrangements that allow, in the event of counterparty default, the netting of claims and obligations in relation to financial and credit derivatives, as well as securities financing transactions (SFTs). In particular, there are ISDA agreements (for transactions in derivatives) and GMRAs (for repurchase agreements).

For the purposes of preparing the tables and in compliance with the provisions of IFRS 7 and the new provisions that govern the financial statements of banks, the following are noted:

- the effects of the potential offsetting of the balance sheet values of financial assets and liabilities are indicated under column (d) "Financial instruments", together with the fair value of financial collateral consisting of securities;
- the effects of the potential offsetting of the exposure with the relative cash collateral are included under column (e) "Cash deposits received/provided as collateral";
- repurchase agreement transactions are recognised in the tables based on the amortised cost measurement criterion, while the relative collateral is measured at fair value. Derivatives transactions are recognised at fair value.

These effects are calculated for each individual counterparty included in a netting framework arrangement, to the extent of the exposure indicated in column (c).

Based on the preparation methods indicated above, the netting arrangements between financial instruments and the relative collateral permit a significant reduction in credit/debt exposure to the counterparty, as indicated under column (f) "Net amount".

Section 10 – Securitisations

Qualitative disclosure

Securitisations: objectives and the roles undertaken by the Bank

Own securitisations

The own securitisations of the Intesa Sanpaolo Group may be differentiated into:

- securitisations that, through the conversion of the loans sold into refinanceable securities, form part of the overall general policy of strengthening of the Group's liquidity position and are not standard securitisations as they do not transfer the risk outside the Group;
- securitisations structured with the objective of achieving economic benefits from the optimisation of the loan portfolio, the diversification of funding sources and the reduction of their cost ("originated securitisations" and Asset Backed Commercial Paper programmes) or in order to provide service to customers.

The Group conducts these transactions using Special Purpose Entities (SPEs), namely vehicles that enable an entity to raise resources through the securitisation of part of its assets. In general this involves the spin-off of a package of balance sheet assets (generally loans) and its subsequent transfer to a vehicle that, to finance the purchase, issues securities, which are later placed in the market or through a private placement. Funds raised in this way are reversed to the seller, whereas the commitments to the subscribers are met using the cash flows generated by the loans sold.

Standard securitisations

The securitisations in this category are as follows:

– Da Vinci:

During 2015 the Da Vinci synthetic securitisation was concluded.

The transaction was structured by Banca Intesa and aimed at covering and actively managing its risk exposure in the aircraft and aeronautic sector.

– Intesa Sec 3:

Transaction structured in 2006 by Banca Intesa on a portfolio consisting of 72,570 "performing" residential mortgages, issued predominantly in Northern Italy, to private individuals, and guaranteed by first lien mortgages, for an original book value of 3,644 million euro. This transaction, essentially aimed at reducing the liquidity gap between medium-term loans and short-term deposits, was carried out through the sale of the abovementioned portfolio to the vehicle Intesa Sec 3 S.r.I., which issued mortgage-backed securities placed with institutional investors. The rating agencies used were S&P and Moody's.

– Cr Firenze Mutui:

At the year end Banca CR Firenze had an outstanding securitisation relating to "performing" mortgages, carried out in the fourth quarter of 2002, through the special purpose vehicle CR Firenze Mutui S.r.l.. For this transaction the vehicle had issued securities for 521 million euro. The rating agencies used were S&P, Fitch and Moody's.

Intesa Sec Npl:

This transaction, completed in 2001, involved the securitisation of doubtful loans relating to 6,997 positions represented by residential and commercial mortgages originating from the Cariplo loan portfolio, acquired by IntesaBci through the merger at the end of 2000. Around 53% of the loans related to corporate counterparties resident in Italy, around 44% to households and the remaining 3% to other operators. This transaction led to the sale of loans for a gross value of 895 million euro, transferred "without recourse" to the special purpose vehicle IntesaBci Sec NPL, for a sale price of 516 million euro. The transaction was funded by the special purpose vehicle through the issue of bonds in five tranches with a total nominal value of 525 million euro. The first three (class A of 274 million euro with a AAA rating; class B of 72 million euro with a AA rating; and class C of 20 million euro with an

A rating) were subscribed by Morgan Stanley, Crédit Agricole-Indosuez and Caboto and they subsequently placed them with institutional investors. The final two tranches (class D of 118 million euro and class E of 41 million euro, both unrated) on the other hand were subscribed by IntesaBci. The rating agencies used were Fitch and Moody's.

– Intesa Sec:

During 2000 Banca Intesa carried out a securitisation of mortgages of the Group. The portfolio, placed in the market through the special purpose vehicle Intesa Sec, consisted of over 20,000 performing mortgages granted to private individuals. Against loans with a residual capital of around 993 billion Italian lira purchased at nominal value, the vehicle issued three tranches of rated securities for a value of 977 billion that were placed with institutional investors. The fourth unrated tranche of around 16 billion was subscribed for directly by the Group. This transaction was part of an operational strategy aimed at improving the return on capital by reinvesting the liquidity generated and using the regulatory capital made available. The rating agencies used were Fitch and Moody's.

Intesa Sec positions in the portfolio of the Parent Company amounted to less than 1 million euro and therefore were not shown in the tables concerning own securitisations.

– Electricity Securitisation:

This transaction was conducted in 2011 on a portfolio of trade receivables in the electricity sector originated by primary customers and purchased without recourse by the Intesa Sanpaolo Group. Risks of the portfolio of receivables were subsequently securitised. Against receivables with a nominal value of approximately 650 million euro, numerous tranches of unrated securities were issued. To close the transactions, the Group used the vehicles Trade Investment Receivable Vehicle S.a.r.l., Hermes Trade Receivables S.a.r.l. and Duomo Funding Plc.

Gas Securitisation:

The Gas transaction, involving securitisation of trade receivables in the gas sector for 77 million euro, was completed in 2011 and entered repayment in May 2014. The capital structure was almost fully repaid. The vehicles used for the transaction were Trade Receivables Investment Vehicle S.a.r.l. and Duomo Funding Plc.

– Food & Beverages Securitisation:

The transaction has been carried out in several tranches starting from 2012, on portfolios of trade receivables in the food & beverages sector originated by primary customers and purchased without recourse by the Intesa Sanpaolo Group. The risk of the portfolio was subsequently securitised. Against receivables numerous tranches of unrated securities were issued.

The securitisation of trade receivables in the food & beverages sector was expanded during 2015, bringing the nominal value of securitised receivables from 597 to 674 million euro. For these transactions, the Group used the vehicles Trade Investment Receivable Vehicle S.a.r.l., Hermes Trade Receivables S.a.r.l., Lana Trade Receivables S.a.r.l. and Duomo Funding Plc.

- Automotive, Electronics and Mechanics Securitisation (Conan):

The transaction has been carried out in several tranches starting from 2012, on portfolios of trade receivables in the automotive sector originated by primary customers and purchased without recourse by the Intesa Sanpaolo Group. The risk of the portfolio was subsequently securitised. Against receivables numerous tranches of unrated securities were issued.

This securitisation was expanded during 2015, bringing the nominal value of securitised receivables from 380 to 490 million euro. For these transactions, the Group used the vehicles Trade Investment Receivable Vehicle S.a.r.l., Hermes Trade Receivables S.a.r.l., Lana Trade Receivables S.a.r.l. and Duomo Funding Plc.

– Electricity 2 Securitisation:

During 2015 the Electricity 2 transaction was concluded, involving securitisation of trade receivables in the electricity sector for 50 million euro, started in 2013. The vehicles used for the transaction were Hermes Trade Receivables S.a.r.l. and Duomo Funding Plc.

– Gas 2 Securitisation:

These transactions were conducted in 2013 on portfolios of trade receivables in the gas sector originated by primary customers and purchased without recourse by the Intesa Sanpaolo Group. Risks of the portfolio of receivables were subsequently securitised. Against receivables with a nominal value of approximately 35 million euro, numerous tranches of unrated securities were issued. To close the transactions, the Group used the vehicles Hermes Trade Receivables S.a.r.l and Duomo Funding Plc.

– GARC Securitisation:

In 2014 Intesa Sanpaolo launched the "GARC" (Active Credit Risk Management) project to create a platform to monitor credit risk in performing portfolios. The initiative involved the systematic acquisition of guarantees (both personal guarantees and collateral) to support lending to SMEs, a

segment which, as a result of the crisis, was hit by significant difficulties in access to credit. This type of transactions provides synthetic hedging of default risk (failure-to-pay, bankruptcy and restructuring) of granular portfolios and freeing up of economic and regulatory capital, as envisaged by the current Supervisory Regulations on the matter (EU Regulation 575/2013 and Bank of Italy Circular 285/2013). For a description of the 2015 transactions, related to this project, reference should be made to "Securitisations carried out during the period".

– Telephony Securitisation:

These transactions were conducted in 2014 on portfolios of trade receivables in the telephony sector originated by primary customers and purchased without recourse by the Intesa Sanpaolo Group. Risks of the portfolio of receivables were subsequently securitised. Against receivables with a nominal value of approximately 150 million euro, numerous tranches of unrated securities were issued. For this transaction, the vehicles Trade Investment Receivable Vehicle S.a.r.l., Hermes Trade Receivables S.a.r.l. and Duomo Funding Plc were used. The securities issued are unrated.

Fuel Securitisation

With regards to transactions in 2015, reference should be made to "Securitisations carried out during the period".

Tibet Securitisation

Asset-Backed Commercial Paper (ABCP) programmes

In accordance with IAS/IFRS, Intesa Sanpaolo controls and fully consolidates:

– Romulus Funding Corporation:

a company based in the USA with the mission of purchasing financial assets, consisting of loans or securities with predefined eligibility criteria originating from Group customers, and financing purchases by issuing Asset-Backed Commercial Papers;

Duomo Funding PLC:

an entity that operates in a similar manner to Romulus Funding Corporation, but is limited to the European market, and is financed through funding agreements with Romulus.

Romulus Funding Corporation and Duomo Funding Plc are asset-backed commercial paper conduits, originally established to support Intesa Sanpaolo's strategy of offering customers an alternative financing channel via access to the international commercial paper market. The assets originated by customers are concentrated in Duomo, leaving Romulus activity of fund-raising on the U.S. market. Nonetheless, due to the subsequent downgrading of Intesa Sanpaolo at the end of 2014, US investors gradually divested without the vehicle being able to find new third party investors with which to place the commercial papers. As at 31 December 2015, around 3.2 billion euro of the around 3.3 billion euro in securities issued by Romulus had been subscribed by the Parent Company Intesa Sanpaolo.

The risks associated with these entities, and more specifically, the potential interest rate and exchange rate risks arising from the operations of the two companies, must be covered in accordance with the Intesa Sanpaolo Group policy for the management of these risks. Risk management performs dynamic hedging on the OTC derivatives market to manage both volatility and interest rate risk, as well as listed derivatives to optimise interest rate strategies. Companies are not generally permitted to take foreign-exchange positions.

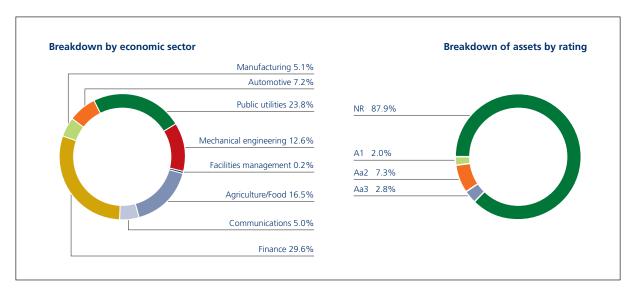

As at 31 December 2015, the investment portfolio of vehicle Romulus included 3,333 million euro in loans to the vehicle Duomo. These are in addition to cash, other assets and the positive fair value of hedging derivatives totalling approximately 2 million euro.

Against those assets, the vehicle issued asset-backed commercial paper (ABCP) with a book value of 3.3 billion euro, which, as mentioned above, were almost fully acquired by the Parent Company.

With regard to the portfolio of the vehicle Duomo, at the end of 2015 – in addition to receivables from Group banks for 1,888 million euro – this portfolio includes loans to customers for 1,420 million euro. In portfolio, the vehicle also holds quotas of a mutual fund originated by an Intesa Sanpaolo Group company with a value of 36 million euro as at 31 December 2015.

The total assets of the conduits Romulus and Duomo, net of dealings between the two vehicles, made up 0.5% of the total consolidated assets.

The portfolio of the two vehicles is approximately 63% accounted for by trade receivables and the remainder by consumer loans (15%), by loans deriving from lease contracts (12%), by inventory-backed loans (7%) and by loans/lease contracts to pharmaceutical companies (3%). Almost all of the eligible assets held by the vehicles are expressed in euro (97.4% of the total portfolio). The remainder is denominated in US dollars. The following information is provided concerning the portfolio of eligible assets.

The unrated share of eligible assets is structured in such a way as to obtain an implicit A/AA rating. With reference to the geographical distribution of the assets held by the two vehicles, please note that approximately 77.5% of the debtors are located in Italy.

"Third party" securitisations

The Intesa Sanpaolo Group also operates in the securitisations market as an investor, although the volume of the existing investments, in both banking and trading books, represents a very small part of the Bank's assets. These operations relate, on the one hand, to the diversification of the risk profile of the managed portfolio and the maximisation of the risk-return target, and on the other hand to the activities involving securities representing public loans, carried out by Group structures specialised in Public Finance.

Nature of the risks, including liquidity risk, relating to the securitised assets

In addition to credit risk, the securitised assets are subject to other types of risk. These include:

- liquidity risk;
- interest rate risk;
- foreign exchange risk.

The nature and scope of the different risks vary based on the type of transaction executed. All securitised assets are also subject to different degrees of operational risk associated with the documentation and the collection of cash flows. In particular, the representation of third party securitisations held in the Group securities portfolio for the purposes of liquidity risk considers the classifications and assessments made based on the fair value policy (see Section on Market risks) for financial statement purposes, as well as their eligibility for refinancing with Central Banks and liquidability, in the absence of which the securities are classified by residual maturity, based on their repayment plans and weighted average life.

Exposures to originated and third party re-securitisations: type of risk

The Group has exposures to re-securitisations only as products issued by third parties ("Third party re-securitisations"). The exposures included in the trading book mainly comprise credit derivatives (essentially cash CDOs) with underlying ABSs. The Group's re-securitisations portfolio shows, in general, immaterial amounts in terms of value of the exposures (See Quantitative Disclosure of this Section), and progressively declining.

Procedures for monitoring changes in credit and market risk of the securitisations

For ABS positions in the trading book, the Financial and Market Risks Department calculates the VaR within the infrastructure of the Internal Model to calculate market risk. Specifically, the method used relates to the treatment of illiquid parameters. The absorption and use are calculated on ABS exposure, in terms of VaR and issuer risk. The ABS risk factor is not included in the Internal Model, as the product is securitised; therefore, neither the regulatory VaR nor the IRC is included.

Risk hedging policies for exposures to securitisations and re-securitisations

Currently, no strategies to purchase protection are in place. In the past, hedging strategies relied on listed indices (such as LCDX) or Credit Default Swaps.

Securitisations: methods for calculating the risk weighted exposures

Intesa Sanpaolo uses the Standardised approach and, starting from 31 December 2012, the IRB Approach (Rating Based Approach – RBA and Supervisory Formula Approach - SFA) to calculate the capital requirement for credit risk from securitisations with underlying assets for which there is the internal model validated in the corresponding credit risk. The currently validated regulatory segments are the Corporate, Mortgage and SME Retail models. The IRB Approach - RBA is used for third-party securitisations with public rating (Agency Rating). The IRB Approach - SFA is used for own securitisations.

Securitisations: accounting policies

The rules for the recognition of securitisations, governed by the IAS/IFRS in the IAS 39 document (paragraphs relating to derecognition), are divided according to whether or not the underlying assets must be derecognised.

In the event of derecognition

When all the risks and benefits from the ownership are effectively transferred, the transferor (originator) shall derecognise the transferred assets from its financial statements and record offsetting entries for the consideration received and any profit or loss from the sale.

If the consideration received is not made up entirely of an amount of available cash, but consists partly of financial assets, these are initially recognised at fair value. Their fair value is also used in the calculation of the profit or loss from the sale.

Should derecognition be permitted, if only a part of the cash flows that derive from a loan is sold, the carrying value of the part maintained is recognised at fair value as at the date of the sale. Any arrangement costs incurred by the originator are recorded in the income statement when incurred as they are not attributable to any financial assets appearing in the financial statements.

The assets sold are derecognised and the profit or loss from the sale, together with any receivable relating to the sale consideration, are recorded in the financial statements as at the date of the completion of the sale. More generally, the entry date for the transaction in the financial statements depends on the contractual clauses. If the cash flows from the assets sold are transferred after the execution of the agreement, for example when there are suspending clauses, the assets are derecognised and the proceeds of the sale are recognised at the time of the transfer of the cash flows.

In the event of no derecognition

If the requirements established by IAS 39 are not met and the securitisation does not therefore qualify for derecognition, the originator records the loan as an offsetting entry for the consideration received.

A common example is when the originator sells a loan portfolio to the special purpose vehicle, but subscribes for the junior class in full (and therefore for the majority of the risks and benefits of the underlying assets) and/or provides a collateral for the transaction.

In this case, the arrangement costs directly incurred by the originator are recorded in the income statement when they are sustained. If there is no derecognition, the loans securitised continue to be recorded in the originator's financial statements.

Subsequently, the originator must recognise any income from the asset transferred and any charges incurred on the liability recorded without offsetting any of the costs and revenues.

The loan portfolio transferred continues to be classified in the loan category that it originally formed part of and, consequently, is measured at amortised cost and valued (individually or on a collective basis) as if the transaction had never taken place.

It should also be noted that, for the securitisations prior to 1 January 2004 (Intesa Sec, Intesa Sec 2 and Intesa Sec Npl), the Group made use of the exemption from compliance with the IAS/IFRS requirements permitted by IFRS 1 on first-time adoption and, consequently, the assets or liabilities sold and derecognised on the basis of the previous accounting standards have not been recorded in the financial statements. For the transactions conducted after that date the provisions of IAS 39 on the derecognition of financial assets and liabilities have been applied.

Provisions for guarantees and commitments

Provisions made on an individual and collective basis, relative to estimated possible disbursements connected to credit risk relative to guarantees and commitments, possibly included in the securitisation

transactions, determined applying the same criteria set out with respect to other types of loans and receivables, are recorded under Other liabilities, as set out by Bank of Italy instructions.

Assessment of exposures to securitisations - banking book

For securities deriving from securitisations, the need to record impairment is assessed if the fair value is lower than the carrying value by a percentage set a priori, or if there is evidence of potential impairment. This process has not changed with respect to the previous year.

If one of these conditions is in place and, as a result of an analysis of the type of securitisation, it is found that the reduction in fair value is due to impairment of the collateral and not to a generic increase in the spread on the secondary market, for bonds issued mainly by vehicles - as the overall structures refer to bankruptcy-remote entities, the analysis concentrates on the performance of the underlyings, which constitute the vehicle's assets, and how this reflects on the notes subordination in the portfolio. Specifically, the procedure involves the following steps:

- monitoring the parameters/triggers/covenants envisaged at issue, which is the basis of the regulation
 of the payment waterfall or the advance termination of the deal. The analysis is based on the periodic
 reports from the administrators and rating agencies;
- specifically for junior tranches of securitisations originated by Intesa Sanpaolo which have reliable business plans, the analysis is conducted on available cash flows. For non-performing products, reference is made to writedowns of receivables and the time expected for the recovery of the underlying credit.

If, as a result of said analysis, there is no evidence of breaches which could compromise payments of principal and interest, it is not necessary to record impairment of the security. Otherwise, if there is the possibility of (full or partial) non-payment of the principal or interest, due to a change in the payment priority and/or impairment of the collateral, it must be verified that the note's credit enhancement can still sufficiently absorb the actual losses. In the event of negative results of this verification, the security must necessarily be impaired.

Impairment is assessed:

- by comparing the residual market value of the collateral and the outstanding amounts of the notes based on the attachment and detachment points, in the event of credit events that result in advance termination of the transaction;
- the fair value is recalculated based on the new rules and the new available cash flows are compared with the credit enhancement of the tranche in the portfolio, in the event of trigger covenants resulting in new payment priorities.

Assessment of exposures to securitisations - trading book

Exposures included in the trading book are measured at fair value. For an illustration of the valuation techniques used to determine fair value, see the relevant chapter (see Section on market risk).

Synthetic securitisations

Synthetic securitisations are usually recognised on the basis of the following rules.

The loans subject to synthetic securitisation continue to be recorded in the assets of the bank (protection buyer) that has retained full ownership of them. The premium paid by the bank to the protection seller for the purchase of the protection Credit Default Swap is recorded under commission expense in the income statement, where the premiums relating to the credit derivatives associated with the guarantees received are recorded. The financial guarantee received from the protection seller also contributes to the determination of the adjustments made to the loans subject to the guarantee (overall and, where applicable, specific).

Any deposit liabilities received by the bank, as a result of the issue of notes by vehicles that sell portions of the risk acquired from the protection seller in the market, are recorded under payables in the balance sheet liabilities.

Securitisations: recognition criteria for prudential purposes

The prudential regulations on securitisations is regulated directly by the CRR, in particular in Part 3, Title II, Chapter 5 and Part 5. In addition the issue is further dealt with in the EBA guidelines:

- to define the normal market conditions when a transaction is not structured to provide support;
- on the significant risk transfer in accordance with articles 243 and 244 of the CRR.

Although the prudential regulations indicated above present clear analogies with the IAS/IFRS measurement criteria, the accounting treatment of securitisations is not material for the purposes of recognition for prudential purposes. Therefore, intermediaries may see situations where the accounting figures and the reports for prudential purposes are different. In the case of the Intesa Sanpaolo Group, this possibility is not significant, as there is only one transaction – Intesa Sec 3 – where the financial statement criteria and prudential reporting criteria are different (see Quantitative Disclosure below). In fact, Intesa Sec 3 is:

- not de-recognised for financial statement purposes, due to the credit enhancement granted in the form of subordinated coverage of the first loss, based on which the Group in accordance with the accounting principles has essentially maintained the risks and benefits of the portfolio transferred;
- de-recognised for prudential supervision purposes, following based on the prudential rules in effect upon creation of the securitisation a significant transfer of risk, as the prudential requirement of exposures to the securitisation in the portfolio ("post-securitisation" requirement) was lower upon structuring of the transaction than the amount calculated on the securitised assets ("ante-securitisation" requirement) (the "static test").

Quantitative disclosure

The tables below detail the net exposures and adjustments for the securitisations. The figures in the tables represent the exposures shown in the financial statements, and include both the positions relating to the banking book and the regulatory trading book.

With the exception of the synthetic GARC securitisation, the Group's originated securitisations include only traditional transactions and ABCP (Asset Backed Commercial Paper) programmes.

Total amount of assets awaiting securitisation

In 2011, Mediocredito Italiano entered into two agreements with the Ministry of Economic Development, which provide subsidies in the form of cash collateral provided as pledge to the bank for two portfolios of credit exposures to be disbursed to SMEs for purposes envisaged by the Italian National Innovation Fund (FNI).

For each of the agreements stipulated, the loan portfolio will be divided into two separate tranches: a junior tranche, exposed to initial losses, and a senior tranche, with a rating equivalent to A-. The tranching of the portfolio is to be determined by the bank by applying the Supervisory Approach Formula. As a guarantee for the two potential portfolios, the Bank has received a total cash collateral amount of 16.4 million euro, into a interest-bearing deposit account, provisionally calculated based on the estimate of available portfolios.

The construction of portfolios regarding the first and second agreement was developed starting from 2011 and from 2012 and it was completed, as contractually agreed, on 31 October 2014. Given the specific investment objectives indicated by the aforementioned agreements and the ongoing difficult economic conditions, applications for special-purpose loans were limited and a limited number of transactions could be carried out (overall, a total of 23 transactions were disbursed, - including 2 redeemed in advance - with a residual value at 31 December 2015 of 13.1 million euro). Given the limited representativeness of the overall customers, the transactions in question were prudentially considered as senior unsecured loans while waiting to define, together with the Ministry of Economic Development, the exact amount of cash collateral to be given as a guarantee of the two portfolios.

The tables above detail the exposures to securitisations by weight band. Details of the exposures included in the banking book and the regulatory trading book are shown in the following tables, including information on the re-securitisations and the type of exposure underlying transactions with weightings of 1250%.

Additional information on market risks of the trading book, including the capital requirement in relation to the securitisations included in that book, is set out in the Section hereof on market risks, which also

presents separately the requirements relating to exposures to securitisations in the trading book, including Credit Default Swaps with underlying exposures to securitisations included in the correlation portfolio.

Securitisations carried out during the period

Tibet Securitisation

In 2015 Banca IMI securitised a loan of 203 million euro guaranteed by a mortgage granted in 2014 for the purchase of a prestigious property in Milan. The vehicle Tibet CMBS S.r.l. was used in the transaction. The securities issued have the following ratings: Senior AA; 1st Mezzanine A, 2nd Mezzanine A-, Junior BB.

Fuel Securitisation

In summer 2015 a transaction was finalised involving the securitisation of trade receivables in the oil refining and distribution sector for an amount of 200 million euro. For this transaction, the vehicles Trade Investment Receivable Vehicle S.a.r.l., Hermes Trade Receivables S.a.r.l., Lana Trade Receivables S.a.r.l. and Duomo Funding Plc were used. The securities issued are unrated.

Haywave Securitisation

In December 2015, Banca IMI assigned to a customer a portion of 37 million euro of a loan that had been granted in 2014 for the purchase of a portfolio of non-residential properties. The customer made the purchase through the vehicle Haywave SPV Srl, which issued two classes of notes, a Senior and a Junior class. The securities issued are unrated.

Mordor, Muttley and Setafia Securitisations

In 2015 Banca IMI sponsored 3 securitisations on trade receivables, in the waste disposal sector for 25 million euro, in the furniture and furnishing sector for 35 million euro and in the pharmaceutical sector for 80 million euro respectively. Receivables generated by primary customers of the Group were purchased by special purpose vehicles established pursuant to Law 130/99 (Mordor, Muttley and Setafia respectively) which proceeded to securitise the risk by issuing securities. For these transactions, the vehicles Mordor SPV S.r.l., Muttley S.r.l., Setafia SPV S.r.l., Hermes Trade Receivables S.a.r.l., Lana Trade Receivables S.a.r.l, ABS Funding S.A. and Duomo Funding Plc were used. All the securities issued are unrated.

GARC Securitisation

In 2015 Intesa Sanpaolo continued its activities relating to the "GARC" (Active Credit Risk Management) project, involving a platform for monitoring credit risk in performing portfolios. The initiative involved the systematic acquisition of guarantees (both personal guarantees and collateral) to support lending of SMEs, a segment which, as a result of the crisis, was hit by significant difficulties in access to credit. This type of transactions provide synthetic hedging of default risk of granular portfolios and freeing up of economic and regulatory capital, as envisaged by the current Supervisory

Regulations on the matter (EU Regulation 575/2013 and Bank of Italy Circular 285/2013). As part of these operations, during the year the junior risk relating to an initial total portfolio of 1.1 billion euro in loans to approximately 2,500 businesses in the Corporate and SME Corporate segments, valued by applying internal models (Advanced IRB) was sold to a specialised investor.

K-Equity Securitisation

In 2015 Intesa Sanpaolo and another leading Italian bank jointly carried out a securitisation transaction that involved transferring their respective exposure to the same debtor company that was deemed could be successfully subject to financial and industrial restructuring, to specifically set up entities. The exposure is accounted for (a) on one hand, by loan portfolios essentially deriving from medium and long-term loans to specific debtors and, (b) on the other, by equity exposures, essentially represented by participating financial instruments (PFI) issued by said debtors. That transfer specifically fulfils the purpose of ensuring the management of said exposures by entities established and managed by specialised third parties to optimise the recovery of the overall exposure by using the know-how and experience of the parties involved in the financial and industrial restructuring processes and, possibly, the granting of new financing to benefit the transferred debtors.

The transaction involves, *inter alia*, the use of a) a securitisation company established pursuant to Law 130/99, Pillarstone Italy SPV S.r.l., which shall purchase and securitise the credit exposures, as well as, where necessary, disburse new financing to the benefit of the assigned debtors and, b) a newly-established company, Pillarstone Italy Holding S.p.A, controlled by third parties, which shall purchase and hold (through assigned assets specifically established pursuant to Article 2447-bis, paragraph 1, letter a) of the Italian Civil Code) the PFIs transferred by the banks, as well as any additional equity exposures subscribed as part of future restructuring operations of transferred debtors.

The Group holds no investments in the abovementioned third-party companies which, therefore, are independent from Intesa Sanpaolo.

Pillarstone Italy SPV shall execute as many securitisations as there are individual assigned debtors, by issuing Senior and Junior notes, fully subscribed by each bank. Therefore, each securitisation already regards the loans due to the assigning banks from a single debtor. Pillarstone Italy Holding's methods of acquiring the equity instruments of the selected debtors may be in cash or through deferred payment, by leveraging the value of the transferred financial instruments.

In 2015 Pillarstone Italy SPV was assigned approximately 122 million euro in medium and long-term non-performing loans, not derecognised for financial reporting purposes or for prudential purposes, and Pillarstone Italy Holding SFP was assigned loans of an immaterial amount, which were derecognised from the assignor's financial statements.

Against said sales, in addition to the notes mentioned above, Super Senior notes subscribed by third parties were also issued. All the securities issued are unrated.

Section 11 - Market risks

Qualitative and quantitative disclosure

The quantification of trading risks is based on daily and periodic VaR of the trading portfolios of Intesa Sanpaolo and Banca IMI, which represent the main portion of the Group's market risks, to adverse market movements of the following risk factors:

Risk factors				
Interest rates	Spreads in credit default swaps (CDS)			
Equity and market indexes	Spreads in bond issues			
Investment funds	Correlation instruments			
Foreign exchange rates	Dividend derivatives			
Implied volatilities	Asset Backed Securities (ABS)			
	Commodities			

A number of the other Group subsidiaries hold smaller trading portfolios with a marginal risk (around 1% of the Group's overall risk). In particular, the risk factors of the international subsidiaries' trading portfolios are interest rates and foreign exchange rates, both relating to linear pay-offs.

The table below shows the items of the consolidated Balance Sheet that are subject to market risks, showing the positions for which VaR is the main risk measurement metrics and those for which the risks are monitored with other metrics. The latter mostly include the sensitivity analysis to the different risk factors (interest rate, credit spread, etc.).

(millions of euro) **BOOK VALUE** MAIN RISK MEASUREMENT METRICS VaR Risk factors measured (supervisory scope) using metrics included under Other 510,703 101,033 409,670 Assets subject to market risk Financial assets held for trading 50,902 49,920 982 Interest rate risk, credit spread, equity Financial assets designated at fair value 1,374 1.054 320 Interest rate risk, credit spread through profit and loss Financial assets available for sale 55,544 49,951 5,593 Interest rate risk, rischio equity Financial assets held to maturity 1,386 1,386 Interest rate risk Due from banks 33,872 33,872 Interest rate risk Loans to customers 353,616 353.616 Interest rate risk Hedging derivatives 7,059 108 6,951 Interest rate risk Investments in associates and companies 6,950 6,950 Equity risk subject to joint control Liabilities subject to market risk 441,915 485.767 43.852 Due to banks 58,971 58,971 Interest rate risk Due to customers 261,489 Interest rate risk 261,489 Securities issued 113,597 113,597 Interest rate risk 43,480 43,137 343 Interest rate risk Financial liabilities held for trading Financial liabilities designated at fair value through profit and loss Hedging derivatives 8.230 715 7.515 Interest rate risk

Internal model validation

For some of the risk factors indicated above, the Supervisory Authority has validated the internal models for the reporting of the capital absorptions of both Intesa Sanpaolo and Banca IMI.

In particular, the validated risk profiles for market risks are: (i) generic/specific on debt securities and on equities for Intesa Sanpaolo and Banca IMI, (ii) position risk on quotas of UCI underlying CPPI (Constant Proportion Portfolio Insurance) products for Banca IMI, (iii) position risk on dividend derivatives and (iv) position risk on commodities for Banca IMI, the only legal entity in the Group authorised to hold open positions in commodities.

The Supervisory Authority authorised the Group to extend the internal model to specific risk on debt securities from the third guarter of 2012.

Effective from June 2014, market risks are to be reported according to the internal model for capital requirements for the Parent Company's hedge fund portfolios.

Starting from 1 July 2014, the capital requirements deriving from the use of internal models will benefit from the reduction in the prudential multipliers established by the Supervisory Authority following completion of the previously recommended corrective actions. Following that reduction, the prudential multipliers for both banks were set at 3.4, both for current VaR values and for those in stress conditions.

Breakdown of capital requirements by Calculation

(milions of euro)

	31.12.2015	31.12.2014
Total risk weighted exposures: market risk	1,326	1,318
Standardised approach	228	333
Position risk on debt instruments	104	153
Position risk on equity exposures	72	90
Foreign exchange risk	52	90
Position risk on commodities	-	-
Internal models	1,098	985
Total risk weighted exposures: concentration risk	-	-

Under position risk, the requirements relating to exposures to securitisations in the trading book are presented separately, amounting to 141 million euro, including 26 million euro referring to Credit Default Swaps with underlying exposures to securitisations included in the correlation portfolio.

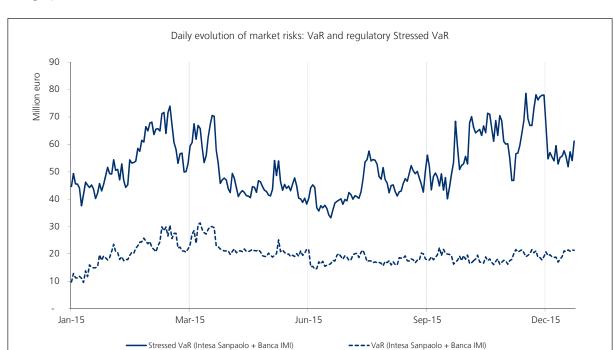

Stressed VaR

The requirement for stressed VaR is included when determining capital absorption effective from 31 December 2011. The requirement derives from the determination of the VaR associated with a market stress period. This period was identified considering the following guidelines, on the basis of the indications presented in the Basel document "Revision to the Basel 2 market risk framework":

- the period must represent a stress scenario for the portfolio;
- the period must have a significant impact on the main risk factors for the portfolios of Intesa Sanpaolo and Banca IMI;
- the period must allow real historical series to be used for all portfolio risk factors.

In keeping with the historical simulation approach employed to calculate VaR, the latter point is a discriminating condition in the selection of the holding period. In fact, in order to ensure that the scenario adopted is effectively consistent and to avoid the use of driver or comparable factors, the historical period must ensure the effective availability of market data.

As at the date of preparation of the document, the period relevant to the measurement of stressed VaR was set as 1 January to 30 December 2011 for Intesa Sanpaolo and as 1 July 2011 to 30 June 2012 for Banca IMI.

The graph below shows the trend of the measures

The table below shows the summary measures relating to the regulatory capital with the breakdown for current VaR measures and VaR in stress conditions.

Current daily value at risk – Summary of 2015 performance

(millions of euro)

	average 4th quarter	4th quarter last one	minimum 4th quarter	maximum 4th quarter	average 3rd quarter	average 2nd quarter	average 1st quarter
Intesa Sanpaolo	4.9	6.7	3.6	6.7	6.1	11.7	9.7
Banca IMI	14.1	14.3	11.6	17.5	12.1	9.6	10.7
Total	19.0	21.0	15.2	24.2	18.2	21.3	20.4

Value at risk in stress condition – Summary of 2015 performance

(millions of euro)

	average 4th quarter	4th quarter last one	minimum 4th quarter	maximum 4th quarter	average 3rd quarter	average 2nd quarter	average 1st quarter
Intesa Sanpaolo	16.5	16.7	14.5	19.2	19.9	17.7	18.4
Banca IMI	45.5	38.2	30.8	62.4	25.4	29.2	35.9
Total	62.0	54.9	45.3	81.6	45.3	46.9	54.3

VaR

The analysis of market risk profiles relative to the trading book uses various quantitative indicators and VaR is the most important. Since VaR is a synthetic indicator which does not fully identify all types of potential loss, risk management has been enriched with other measures, in particular simulation measures for the quantification of risks from illiquid parameters (dividends, correlation, ABS, hedge funds).

VaR estimates are calculated daily based on simulations of historical time-series, a 99% confidence level and 1-day holding period.

The section "Quantitative information" presents the estimates and evolution of VaR, defined as the sum of VaR and of the simulation on illiquid parameters, for the trading book of Intesa Sanpaolo and Banca IMI.

Incremental Risk Charge (IRC)

The Incremental Risk Charge (IRC) is the maximum potential loss in the credit trading portfolio resulting from an upgrade/downgrade or bankruptcy of the issuers, over a 1-year period, with a 99.9% confidence level. This measure is additional to VaR and enables the correct representation of the specific risk on debt securities and credit derivatives because, in addition to idiosyncratic risk, it also captures event and default risk.

Stress tests

Stress tests measure the value changes of instruments or portfolios due to changes in risk factors of unexpected intensity and correlation, or extreme events, as well as changes representative of expectations of the future evolution of market variables. Stress tests are applied periodically to market risk exposures, typically adopting scenarios based on historical trends recorded by risk factors, for the purpose of identifying past worst case scenarios, or defining variation grids of risk factors to highlight the direction and non-linearity of trading strategies.

Sensitivity and greeks

Sensitivity measures make risk profiling more accurate, especially in the presence of option components. These measure the risk attributable to a change in the value of a financial position to predefined changes in valuation parameters including a one basis point increase in interest rates.

Level measures

Level measures are risk indicators which are based on the assumption of a direct relationship between the size of a financial position and the risk profile. These are used to monitor issuer/sector/country risk exposures for concentration analysis, through the identification of notional value, market value or conversion of the position in one or more benchmark instruments (so-called equivalent position).

Daily VaR evolution

During the fourth quarter of 2015, the market risks originated by Intesa Sanpaolo and Banca IMI declined compared to the previous period: the average daily VaR for the fourth quarter of 2015 was 98.3 million euro, down on the third quarter, primarily for Banca IMI.

With regard to the whole of 2015, the Group's average risk profile (94.4 million euro) increased compared to the average values in 2014 (48.5 million euro).

Daily VaR of the trading book for Intesa Sanpaolo and Banca IMI®

, , , , , , , , , , , , , , , , , , ,					(millions of euro)
	average 4th guarter	minimum 4th quarter	maximum 4th quarter	average 3rd guarter	average 2nd guarter	average 1st guarter
	quarter	quarter	quarter	quarter	quarter	quarter
Intesa Sanpaolo	13.2	11.0	15.9	11.6	13.8	12.1
Banca IMI	85.0	70.7	94.7	104.7	71.1	64.6
Total	98.3	84.5	107.9	116.3	84.9	76.7

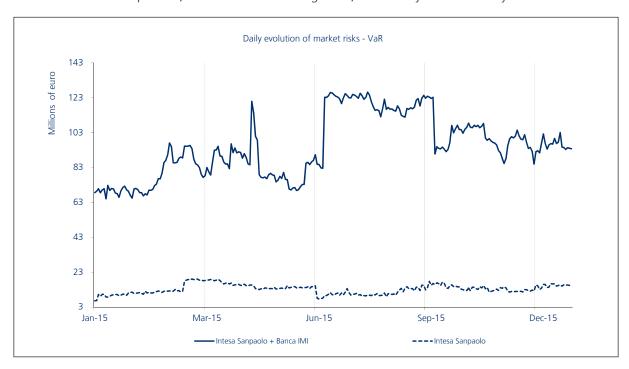

⁽a) Each line in the table sets out past estimates of daily operating VAR calculated on the quarterly historical time-series respectively of Intesa Sanpaolo and Banca IMI; minimum and maximum values for Intesa Sanpaolo and Banca IMI are estimated using aggregate historical time-series and therefore do not correspond to the sum of the individual values in the column.

Daily VaR of the trading book for Intesa Sanpaolo and Banca IMI – Comparison between 2015 and 2014 (a)

						(mi	illions of euro)
		2015				2014	
	average	minimum	maximum	last day	average	minimum	maximum
Intesa Sanpaolo	12.7	6.0	18.5	14.6	9.1	5.6	12.0
Banca IMI	81.7	54.0	116.3	78.7	39.3	23.8	66.4
Total	94.4	64.6	125.8	93.3	48.5	32.0	73.8

⁽a) Each line in the table sets out past estimates of daily VaR calculated on the historical time-series of the year respectively of Intesa Sanpaolo and Banca IMI; minimum and maximum values for the two companies are estimated using aggregate historical time-series and therefore do not correspond to the sum of the individual values in the column.

The trend in the Group's VaR, shown in the following chart, was mainly determined by Banca IMI.

In the first quarter of 2015 risk grew due to the effect of the increase in exposures on government securities (assumed within the limits approved by the 2015 Risk Appetite Framework). Risk measures then peaked due to financial market volatility (particularly government credit spreads) linked to the uncertainty associated with the Greek debt crisis. In the period indicated, the Group's overall limit was never exceeded. The reduction in September was due to the exclusion of particularly volatile credit spread scenarios. During the fourth quarter, risks declined slightly on average. The VaR performance was due to government security transactions and an increase in the interest rate component.

Contribution of risk factors to total VaR®

4th quarter 2014	Shares	Hedge fund	Rates	Credit spread	Foreign exchange rates	Other parameters	Commodities
Intesa Sanpaolo	24%	11%	14%	18%	28%	5%	0%
Banca IMI	4%	0%	24%	67%	1%	3%	1%
Total	7%	2%	22%	60%	5%	3%	1%

⁽a) Each line in the table sets out the contribution of risk factors considering 100% the overall capital at risk, calculated as the average of daily estimates in the fourth quarter of 2014, broken down between Intess Sanpaolo and Banca IMI and indicating the distribution of overall capital at risk.

For Intesa Sanpaolo, the breakdown of risk profile in the fourth quarter of 2015, with regard to various factors, shows a general prevalence of equity risk, which accounted for 24% of total VaR; that percentage relates to the equity portion of hedge funds, for which full transparency is available. Credit spread risk, which includes the risk associated with sovereign government bonds, was the most significant component for Banca IMI, representing 67% of the total.

Contribution of strategies to portfolio breakdown (a)

	31.12.2015	31.12.2014
- Catalist Driven	15.0%	18.0%
- Credit	42.0%	45.0%
- Directional trading	18.0%	16.0%
- Equity hedged	19.0%	15.0%
- Equity Long Only	5.8%	5.5%
- Multi-strategy	0.2%	0.5%
Total hedge funds	100.0%	100.0%
(a)		

The table sets out on every line the percentage of total cash exposures calculated on amounts at period-end.

In 2015 the hedge fund portfolio maintained an asset allocation with a focus on strategies relating to distressed credit (42% of the total in terms of portfolio value).

Risk control with regard to the trading activity of Intesa Sanpaolo and Banca IMI also uses scenario analyses and stress tests. The impact on the income statement of selected scenarios relating to the evolution of stock prices, interest rates, credit spreads and foreign exchange rates as at the end of December is summarised in the following table:

(mil	lions	of	euro)

	EQI	UITY	INTERI	EST RATES	CREDIT	SPREADS		EXCHANGE TES	COMM	IODITY
	volatility +10% and prices -5%	volatility -10% and prices +5%	+40bp	lower rate	-25bp	+25bp	-10%	+10%	-50%	+50%
Total	-13	4	-129	59	280	-278	26	-16	7	-2

In particular:

- on stock market positions, a 5% decrease in stock prices with a resulting 10% increase in volatility would have led to a loss of approximately 13 million euro;
- on interest rate exposures, a rise of the curves of 40 basis points would have had a negative impact of
 129 million euro, whereas a scenario with near zero rates would have led to potential gains;
- on exposures sensitive to credit spread fluctuations, a 25 basis point widening in spreads would have led to a 278 million euro loss;
- on foreign exchange exposures, were the Euro to appreciate against the US dollar by 10%, a loss of approximately 16 million euro would be recorded;
- lastly, on commodity exposures, gains would be recorded in case of a 50% decrease in prices; conversely, in case of an increase, the potential losses would be equal to 2 million euro.

Backtesting

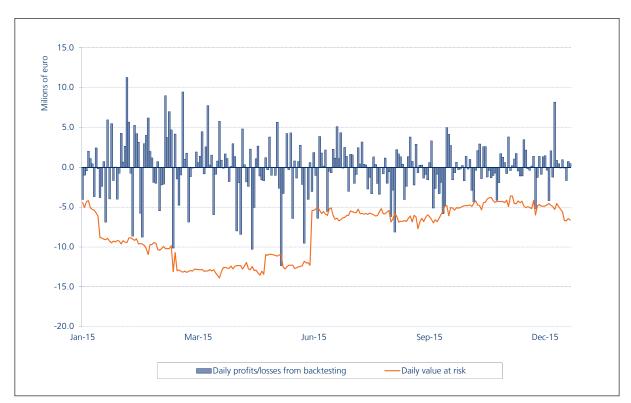

The effectiveness of the VaR calculation methods must be monitored daily via backtesting which, as concerns regulatory backtesting, compares:

- the daily estimates of value at risk;
- the daily profits/losses based on backtesting which are determined using actual daily profits and losses achieved by individual desks, net of components which are not considered in backtesting such as commissions and intraday activities.

Backtesting allows verification of the model's capability of correctly seizing, from a statistical viewpoint, the variability in the daily valuation of trading positions, covering an observation period of one year (approximately 250 estimates). Any critical situations relative to the adequacy of the Internal Model are represented by situations in which daily profits/losses based on backtesting highlight more than three occasions, in the year of observation, in which the daily loss is higher than the value at risk estimate. Current regulations require that backtesting is performed by taking into consideration both the actual P&L series recorded and the theoretical series. The latter is based on revaluation of the portfolio value through the use of valuation models adopted for the VaR measurement calculation. The number of significant backtesting exceptions is determined as the maximum between those for actual P&L and theoretical P&L.

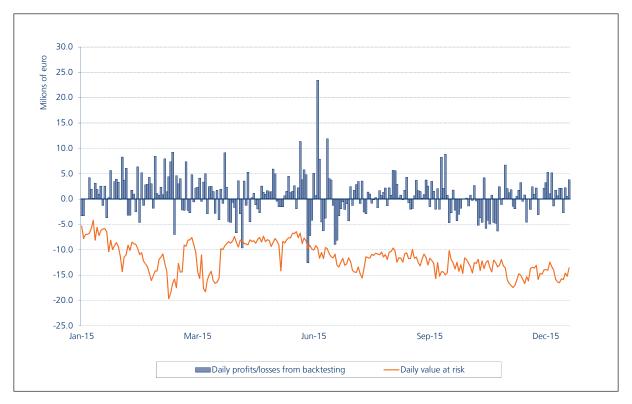

Backtesting in Intesa Sanpaolo

The four backtesting exceptions of Intesa Sanpaolo are to be attributed to the linear equity component of the hedge fund portfolios, the effects of the Greek debt crisis on fixed-income markets and interest-rate dynamics, with particular regard to the performance of cross-currency swaps.

Backtesting in Banca IMI

The two backtesting exceptions of Banca IMI refer to the actual P&L data. The losses derive from the increased volatility as a result of the worsening of the Greek debt crisis.

Issuer risk

Issuer risk in the trading portfolio is analysed in terms of mark to market, with exposures aggregated by rating class, and is monitored through a system of operating limits based on both rating classes and concentration indexes.

Breakdown of exposures by type of issuer for Intesa Sanpaolo and Banca IMI

	Total	of which			ich				
		Corporate	Financial	Emerging	Covered	Government	Securitis.		
Intesa Sanpaolo	67%	15%	4%	0%	18%	58%	5%		
Banca IMI	33%	15%	5%	3%	12%	1%	63%		
Total	100%	15%	4%	1%	16%	39%	24%		

⁽a) In the Total column, the table reports the contribution to total exposure of Intesa Sanpaolo and Banca IMI to issuer risk, breaking down the contribution to exposure by type of issuer. The scope is the trading book subject to issuer credit limit (excluding Italian Government and AAA own securities) including cds

The breakdown of the portfolio subject to issuer risk shows the prevalence of securities in the government segment for Intesa Sanpaolo and the securitisation segment for Banca IMI.

Operating limits

The structure of limits reflects the risk level deemed to be acceptable with reference to single business areas, consistent with operating and strategic guidelines defined by top management. The attribution and control of limits at the various hierarchical levels implies the assignment of delegated powers to the heads of business areas, aimed at achieving the best trade-off between a controlled risk environment and the need for operating flexibility. The functioning of the system of limits and delegated powers is underpinned by the following basic concepts of hierarchy and interaction.

The application of such principles led to the definition of a structure of limits in which the distinction between first level and second level limits is particularly important:

 first level limits (VaR): at the level of individual legal entities, these are approved by the Management Board, concurrently with approval of the RAF. Limit absorption trends and the relative congruity

- analysis are periodically assessed by the Group Financial Risks Committee. Following approval, these limits are then allocated to the desks of the individual legal entities, considering the proposals by the business units;
- second level limits (sensitivity and greeks): they have the objective of controlling operations of the
 various desks on the basis of differentiated measures based on the specific characteristics of traded
 instruments and operating strategies, such as sensitivity, greeks and equivalent exposures.

In the 2015 RAF, a total limit of 130 million euro (125 million euro from June onwards) was set for the trading component, representing an increase compared to the previous year in relation to the guidelines for the RAF concerning the growth of the securities portfolio.

With respect to the component sub-allocated to the organisational units, it may be noted that the use of the VaR limit (held for trading component) for Intesa Sanpaolo averaged 48% in 2015, with a maximum use of 69%. For Banca IMI, the average VaR limit came to 83%, with a maximum use of 116%. It should be specified that for Banca IMI the VaR limit also includes the AFS component, inasmuch as these assets are managed in close synergy with HFT assets.

The use of the IRC limits at year end amounted to 37.6% for Intesa Sanpaolo (limit of 290 million euro) and 29.5% for Banca IMI (limit of 330 million euro). The table below shows the summary data concerning the quarterly performance.

Incremental Risk Charge – Summary of 2015 performance

	average 4th	4th quarter last	minimum 4th	maximum 4th	average 3rd	average 2nd	average 1st
	quarter	one	quarter	quarter	quarter	quarter	quarter
Intesa Sanpaolo	105.2	109.8	96.1	111.7	113.6	130.8	147.8
Banca IMI	106.4	95.2	87.2	142.1	93.2	139.0	182.3
Total	211.6	205.0	183.3	253.8	206.8	269.8	330.1

The use of VaR operating limits on the AFS component (excluding Banca IMI) at year end was 65%. For 2015, this limit was revised from 135 million euro to 200 million euro. The new limit is in line with the RAF guidelines concerning the increase in the securities portfolio.

Description of the level of compliance with the rules governing the systems and controls aimed at ensuring prudent and reliable valuations of the positions included in the regulatory trading book

Fair Value Policy

The Intesa Sanpaolo Group's Fair Value Policy governs the measurement of financial instruments after initial recognition with reference to the Group's portfolios measured at fair value.

The Fair Value Policy, in all of its constituent documents, is governed and formalised by the Financial and Market Risks Department, applies to the Parent Company and all the consolidated subsidiaries, is integrated into the risk measurement and management processes, is subject to regular review and updating and approval by the relevant functions, and is used for the preparation of the financial statement documents. The related accounting criteria are detailed below. A summary is also provided below of the various stages of the process of measurement of financial instruments together with details of the valuation models used to measure the financial instruments.

Accounting criteria: fair value measurement methods (Fair value hierarchy)

The application of IFRS 13 governing fair value measurement and related disclosure became mandatory from 1 January 2013.

The new standard does not extend the scope of application of fair value measurement, but rather provides a guide as to how to measure the fair value of financial instruments and non-financial assets and liabilities where already required or permitted by other accounting standards. The aim was to concentrate into a single standard the rules for measurement at fair value, previously contained in various standards, in some cases with prescriptions in conflict with one another.

The fair value is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants (i.e. not as part of the compulsory liquidation or a below-cost sale) as at the measurement date. Fair value is a market measurement criterion, not specifically referring

to a single entity. Underlying the definition of fair value is the assumption that the company is carrying out normal operations, without any intention of liquidating its assets, significantly reducing the level of operations or carrying out transactions at unfavourable conditions.

A business has to measure the fair value of an asset or liability by adopting the assumptions that would be used by market operators to determine the price of an asset or liability, presuming that the market operators act with a view to satisfying their own economic interest in the best possible way.

Financial instruments

The fair value of financial instruments is determined according to a hierarchy of criteria based on the origin, type and quality of the information used. In detail, this hierarchy assigns top priority to quoted prices (unadjusted) in active markets and less importance to unobservable inputs. Three different levels of input are identified:

- level 1: input represented by quoted prices (unadjusted) in active markets for identical assets or liabilities accessible by the entity as at the measurement date;
- level 2: input other than quoted prices included in level 1 that are directly or indirectly observable for the assets or liabilities to be measured;
- level 3: unobservable input for the asset or liability.

As level 1 inputs are available for many financial assets and liabilities, some of which are traded in more than one active market, the company must pay particular attention to defining both of the following aspects:

- the principal market for the asset or liability or, in the absence of a principal market, the most advantageous market for the asset or liability;
- whether the company can complete a transaction involving the asset or liability at that price and in that market as at the measurement date.

The Intesa Sanpaolo Group considers the principal market of a financial asset or liability to be the market in which the Group generally operates.

A market is regarded as active if quoted prices, representing actual and regularly occurring market transactions considering a normal reference period, are readily and regularly available from an exchange, dealer, broker, industry group, pricing service or regulatory agency.

In specific cases regulated by internal policies, research is carried out in order to verify the significance of official market values, despite being quoted on regulated markets.

In the event of a significant reduction in the volume or level of operations compared to normal operations for the asset or liability (or for similar assets or liabilities) highlighted by a number of indicators (number of transactions, limited significance of market prices, significant increase in implicit premiums for liquidity risk, expansion or increase of the bid-ask spread, reduction or total lack of market for new issues, limited publicly-available information), analyses of the transactions or of the quoted prices are carried out.

The following are considered as level 1 financial instruments: contributed bonds (i.e. quoted on the EuroMTS circuit, or for which it is possible to continuously derive from the main price contribution international platforms at least three bid and ask prices), contributed harmonised mutual funds, spot exchange rates, and derivatives for which quotations are available on an active market (for example, futures and exchange traded options)¹.

Finally, level 1 instruments also include hedge funds for which the fund administrator provides the NAV (Net Asset Value) with the frequency established in the subscription contract, and the checklist, which is the summary document of significant information on underlying assets of the fund, does not highlight any critical points in terms of liquidity risk or counterparty risk.

For level 1 financial instruments, the current bid price is used for financial assets and the current ask price for financial liabilities, struck on the principal active market at the close of the reference period.

For financial instruments with a scarcely significant bid-ask spread or for financial assets and liabilities with offsetting market risks, mid-market prices are used (again referred to the last day of the reference period)

¹ Bonds valued using official closing prices and/or fixing provided by local authorities (central bank, monetary authority or local stock exchange) may be classified as level 1, but only for international branches and banks and pursuant to local regulatory requirements, where the decentralised Risk Management units confirm that there is an active market, and when the Financial and Market Risks Department expressly authorises it.

instead of the bid or ask price.

Conversely, all other financial instruments that do not belong to the above-described categories or that do not have the contribution level defined by the Fair Value Policy are not considered level 1 instruments.

When no quotation on an active market exists or the market is not functioning regularly, that is when the market does not have a sufficient and continuous number of trades, and bid-ask spreads and volatility that are not sufficiently contained, the fair value of the financial instruments is mainly determined through the use of valuation techniques whose objective is the establishment of the price at which, in an orderly transaction, the asset is sold or the liability transferred between market participants, as at the measurement date, under current market conditions.

Such techniques include:

- the use of market values that are indirectly linked to the instrument to be measured, deriving from products with the same risk profile (level 2);
- valuations performed using even partially inputs not identified from parameters observed on the market, for which estimates and assumptions made by the valuator are used (level 3).

In the case of level 2 inputs, the valuation is not based on the price of the same financial instrument to be measured, but on prices or credit spreads presumed from official listing of instruments which are similar in terms of risk factors, using a given calculation methodology (valuation model). The use of this approach requires the identification of transactions on active markets in relation to instruments that, in terms of risk factors, are comparable with the instrument to be measured. Level 2 calculation methodologies reproduce prices of financial instruments quoted on active markets (model calibration) and do not contain discretional parameters – parameters for which values may not be inferred from quotations of financial instruments present on active markets or fixed at levels capable of reproducing quotations on active markets – that significantly influence the final valuation.

The calculation of the fair value of certain types of financial instruments is based on valuation models which consider parameters not directly observable on the market, therefore implying estimates and assumptions on the part of the valuator (level 3). In particular, the valuation of the financial instrument uses a calculation methodology which is based on specific assumptions of:

- the development of future cash flows, which may be affected by future events that may be attributed probabilities presumed from past experience or on the basis of the assumed behaviour;
- the level of specific input parameters not quoted on active markets, for which information acquired from prices and spreads observed on the market is in any case preferred. Where this is not available, past data on the specific risk of the underlying asset or specialised reports are used (e.g. reports prepared by Rating agencies or primary market players).

The following are measured under the Mark-to-Model Approach:

- debt securities and complex credit derivatives (CDOs) included among structured credit products and credit derivatives on index tranches;
- hedge funds not included in level 1;
- shareholding and other equities measured using models based on discounted cash flows;
- some loans, of a smaller amount, classified in the available-for-sale portfolio;
- derivative transactions relating to securitisations and equity-risk structured options.

The valuation process of financial instruments entails the following phases:

- identification of the sources for measurements: for each asset class, the Market Data Reference Guide establishes the processes necessary to identify market parameters and the means according to which such data must be extracted and used;
- certification and treatment of market data for measurements: this stage consists of the accurate verification of the market parameters used (verifying the integrity of data contained on the proprietary platform with respect to the source of contribution), reliability tests (consistency of each single figure with similar or comparable figures) and verification of concrete application means. In particular:
 - reference categories are established for the various types of market parameters;
 - o the reference requirements governing the identification of official revaluation sources are set;
 - o the fixing conditions of official figures are established;
 - o the data certification conditions are established;
- certification of valuation models and Model Risk Assessment: this phase is aimed at verifying the consistency and the adherence of the various measurement techniques used with current market

practice, at highlighting any critical aspects in the valuation models used and at determining any adjustments necessary for measurement. The validation process is particularly important at the start of activities in a new financial instrument which requires the development of further valuation models, and when the Bank decides to use a new model to measure payoffs previously managed with models deemed to be less adequate. All models used for the valuation must be submitted to an internal certification process which involves various competent structures or independent companies in highly complex or particularly critical cases;

 monitoring consistency of valuation models over time: periodical monitoring of the adherence to the market of the valuation model in order to promptly discover any gaps and start the necessary verifications and interventions.

A more detailed description of the fair value measurement models can be found below in the section on "Information on valuation models which are concretely used for measurement of financial instruments".

Certification and monitoring of the market parameters and the model risk

As part of its overall monitoring of the controls on the individual transactions dealt with by the ICT Systems Department (IT modules) and the Operations Department (back office controls), the Financial and Market Risks Department monitors and certifies the models used for the valuation processes and the market parameters identified to feed them. If the valuation systems are found to be incapable of providing reliable valuations, the Financial and Market Risks Department values the financial instrument directly using specially developed internal instruments. These activities are broken down into various stages, which are described briefly below.

Identification, certification and treatment of market data and the sources for measurements

The fair value calculation process and the need to distinguish between products which may be measured on the basis of effective market quotes rather than through the application of comparable or mark-tomodel approaches, highlight the need to establish univocal principles in the determination of market parameters. To this end, the Market Data Reference Guide – a document prepared and updated by the Financial and Market Risks Department on the basis of the Group's Internal Regulations approved by the Management bodies of the Parent Company and Group Companies – has established the processes necessary to identify market parameters and the means according to which such parameters must be extracted and used. Such market data may be both elementary and derived data. In particular, for each reference category (asset class), the regulation determines the relative requisites, as well as the cut-off and certification means. The document defines the collection of the contribution sources deemed adequate for the valuation of financial instruments held for any purpose in the proprietary portfolios of the Bank and its subsidiaries. These same sources are used in valuations carried out for third parties under Service Level Agreements, entered into in advance. Adequacy is guaranteed by the respect of reference requirements, which are based on comparability, availability and transparency of the data, or the possibility of extracting the figure from one or more info providing systems, of measuring the contribution bid-ask, and lastly, for OTC products, of verifying the comparability of the contribution sources. For each market parameter category the cut-off time is determined univocally, with reference to the timing of definition of the parameter, the reference bid/ask side and the number of contributions necessary to verify the price. The use of all market parameters in Intesa Sanpaolo is subordinated to their certification (Validation Process) by the Financial and Market Risks Department, in terms of specific controls (verifying the integrity of data contained on the proprietary platform with respect to the source of contribution), reliability tests (consistency of each single figure with similar or comparable figures) and verification of concrete application means.

Model Risk Management

In general, Model Risk is represented by the possibility that the price of a financial instrument is materially influenced by the valuation approach chosen. In the case of complex financial instruments, for which there is no standard valuation method in the market, or during periods when new valuation methods are being established in the market, it is possible that different methods may consistently value the elementary instruments of reference, but provide differing valuations for exotic instruments. The model risk is monitored through a series of analyses and checks carried out at different stages, aimed at certifying the various valuation methods used by the Bank ("Model Validation"), at regularly monitoring the performance of the models in operation to promptly identify any deviation from the market ("Model Risk Monitoring") and at identifying any adjustments to be made to the valuations ("Model Risk

Adjustment", see the section below "Adjustments adopted to reflect model risk and other uncertainties related to the valuation").

Model Validation

In general, all the valuation models used by the Bank must undergo an internal certification process by the various structures involved. The possibility of independent certification issued by high standing financial service companies is also provided for in highly-complex cases and/or in presence of market turbulence (so-called market dislocation). The internal certification process is activated when a new financial instrument that requires an adjustment to the existing valuation methods or the development of new methods starts to be used, or when the existing methods need to be adjusted for the valuation of existing contracts. The validation of the methods involves a series of operational steps, which are adopted where necessary, including the:

- contextualisation of the problem within the current market practice and the relevant available literature;
- analysis of the financial aspects and the types of significant payoff;
- formalisation and independent derivation of the mathematical aspects;
- analysis of the numerical/implementation aspects and tests through the replication, where necessary, of the pricing libraries of the Front Office systems through an independent prototype;
- analysis of the relevant market data, verifying the presence, liquidity and frequency of update of the contributions;
- analysis of the calibration methods, in other words the model's ability to optimise its internal parameters (or meta-data) to best replicate the information provided by the quoted instruments;
- stress tests of the parameters of the model that are not observable in the market and analysis of the impact on the valuation of the complex instruments;
- market tests comparing, where possible, the prices obtained from the model with the quotes available from the counterparties.

If no problems are identified by the above analysis, the Financial and Market Risks Department validates the method, which becomes part of the Group Fair Value Policy and can be used for the official valuations. If the analysis identifies a significant "Model Risk", which, however, is within the limits of the approach's ability to correctly manage the related contracts, the Financial and Market Risks Department selects a supplementary approach to determine the appropriate adjustments to be made to the mark to market, and validates the supplemented approach.

Model Risk Monitoring

The performance of the valuation models in operation is monitored continuously to promptly identify any deviations from the market and implement the necessary assessments and measures. This monitoring is performed in various ways, including:

- repricing of contributed elementary instruments: verifying the model's ability to replicate the market prices of all the quoted instruments considered to be relevant and sufficiently liquid. For interest rate derivatives, an automatic repricing system for elementary financial instruments is used in the Bank's Front Office systems, which enables the systematic verification of any deviations between the model and the market. Where significant deviations are found, especially outside the market bid-ask quotes, the impact on the respective trading portfolios is analysed and any adjustments to be made to the corresponding valuations are quantified;
- comparison with benchmarks: the monitoring method described above is further enhanced by the extensive use of data supplied by qualified external providers (e.g. Markit), which provide consensus valuations from leading market counterparties for interest rate instruments (swaps, basis swaps, cap/floor, European and Bermuda swaptions, CMS, CMS spread options), equity instruments (options on indexes and on single stocks), credit instruments (CDS) and commodity instruments (options on commodity indexes). Such information is far richer than that normally available from standard contribution sources, for example in terms of maturities, underlying assets and strikes. Any significant gap between the model and benchmark data is quantified with respect to the average bid-ask spread supplied by the outside provider and therefore treated as in the previous case. The possibility of extending the comparison with benchmarks to other instruments or underlying assets is constantly monitored;
- comparison with market prices: verification against prices provided by counterparties via Collateral Management, indicative listed prices provided by brokers, intrinsic parameters identified from these indicative listed prices, checks of the most recent revaluation price in relation to the price of

the financial instrument deriving from unwinding, sales, and new similar or comparable transactions.

Adjustments adopted to reflect model risk and other uncertainties related to the valuation

If problems are found by the Model Validation process or the Model Risk Monitoring process in the calculation of the fair value of particular financial instruments, the appropriate Mark-to-Market Adjustments to be made to the valuations are identified. These adjustments are regularly reviewed, also considering market trends, or the introduction of new liquid instruments, different calculation methodologies and, in general, methodological advances which may also lead to significant changes in selected models and their implementation.

In addition to the adjustments relating to the abovementioned factors, the Mark-to-Market Adjustment Policy also provides for other types of adjustments relating to other factors capable of influencing the valuation. These factors essentially involve:

- high and/or complex risk profile;
- position illiquidity determined by temporary or structural market conditions or in relation to the entity of exchange values held (in case of excessive concentration);
- valuation difficulties due to the lack of liquid and observable market parameters.

For illiquid products an adjustment is made to the fair value. This adjustment is generally not very relevant for instruments for which the valuation is supplied directly by an active market (level 1). Specifically, highly liquid quoted securities are valued directly at mid-price, whereas for quoted securities with low liquidity and unquoted securities the bid price is used for long positions and the ask price for short positions. Bonds that are not quoted are valued according to credit spreads that differ based on the position of the security (long or short).

Conversely, for derivatives for which fair value is determined with a valuation technique (levels 2 and 3), the adjustment may be calculated with different means according to the availability on the market of bid and ask prices and products with similar characteristics in terms of contract type, underlying asset, currency, maturity and volumes traded which may be used as benchmarks.

Where none of the indications above is available, stress tests are performed on input parameters deemed to be relevant in the model. The main factors considered to be illiquid (in addition to the inputs for the valuation of structured credit derivatives, to be discussed in further detail below) and for which the respective adjustments have been calculated, are represented in this market context and are connected to risks on Commodities, on Dividends and Variance Swaps, FOI (Consumer price index for blue and white-collar worker households) inflation and options on inflation, on specific indexes such as Rendistato, volatility of 12-month cap indexes, correlations between swap rates and "quanto" correlation (connected to pay offs and index-linking expressed in different currencies).

The management of the Mark-to-Market Adjustment process is formalised with appropriate calculation methodologies on the basis of the different configurations of the points set out above. Calculation of the adjustments depends on the dynamics of the factors indicated above and is disciplined by the Financial and Market Risks Department. The criteria for the release are subordinated to the elimination of the factors indicated above and disciplined by the Financial and Market Risks Department. Such processes are a combination of quantitative elements that are rigidly specified and qualitative elements, valued based on the different configuration over time of the risk factors which generated the adjustments. Thus, the estimates subsequent to initial recognition are always guided by the mitigation or elimination of said risks. For new products, the decision to apply Mark-to-Market Adjustment processes is taken by the New Product Committee upon the proposal of the Financial and Market Risks Department.

Information on valuation models which are concretely used for measurement of financial instruments

The sections below provide a summary of the information, by type of financial instrument (securities, derivatives, structured products), on the valuation models used for the various financial instruments.

I. Valuation model for non-contributed securities

The valuation of non-contributed securities (that is, securities without official listings expressed by an active market) occurs through the use of an appropriate credit spread test, which is estimated starting from contributed and liquid financial instruments with similar characteristics. The sources used to estimate the level of the credit spread are the following:

- contributed and liquid securities of the same issuer;
- credit default swaps on the same reference entity;
- contributed and liquid securities of an issuer with the same rating and belonging to the same sector.

In any case the different seniority of the security to be priced is considered relatively to the issuer's debt structure.

In the case of Italian public issuers, a rating/maturity matrix is defined on the basis of the spread levels on government issues, to which the spreads among the various rating/maturity classes with respect to public issues (regions, provinces, municipalities, government entities) are applied.

Similarly, with respect to financial liabilities designated at fair value through profit and loss, the credit spread of the Intesa Sanpaolo Group is determined and measured based on the bonds issued by the Parent Company, with regular, periodic coupons, maturity beyond one year and quoted on an active market in compliance with IAS/IFRS. The implicit credit rating is determined on the basis of market quotes and subsequently adjusted through interpolation models which generate credit spread curves by type of coupon, maturity and subordination level.

In addition, for bonds that are not quoted on active markets, an extra spread, estimated based on the bid/ask spread recorded on the market, is added to the "fair" credit spread component, to take account of the higher premium demanded by the market compared to similar contributed securities. If there is also an embedded option a further adjustment is made to the spread by adding a component designed to capture the hedging costs of the structure and the illiquidity of the underlying assets. This component is calculated on the basis of the type of option and its maturity.

II. Valuation models for interest rate, foreign exchange, equity, inflation and commodity derivatives

For derivatives, in consideration of their number and complexity, a systematic reference framework has been developed which represents the common elements (calculation algorithms, processing models, market data used, basic assumptions of the model) that are used to measure all categories of derivatives.

Interest rate, foreign exchange, equity, inflation and commodity derivatives, if not traded on regulated markets, are Over The Counter (OTC) instruments, which are bilaterally exchanged with market counterparties and are measured through specific valuation models, fed by input parameters (such as yield, foreign exchange and volatility curves) observed on the market and subject to the monitoring processes illustrated above.

The table below illustrates the main models used to evaluate OTC derivatives on the basis of the category of underlying asset.

Underlying class	Valuation models	Market data and input parameters
Interest rate	Net Present Value, Black, SABR, Libor Market Model, 1- and 2-factor Hull-White, Mixture of 1- and 2-factor Hull-White, Bivariate lognormal, Rendistato, Hagan replication	Interest rate curves (deposits, FRA, Futures, OIS, swap, basis swap, Rendistato basket), cap/floor/swaption option volatility, correlation between interest rates,
Foreign exchange rate	Net present Value FX, Garman-Kohlhagen, Lognormal with Uncertain Volatility (LMUV), Stochastic Local Volatility (SLV)	Interest rate curves, spot and forward FX curves, FX volatility, "quanto" volatility and correlations
Equity	Accrual, Net present Value Equity, Generalised Black-Scholes, Heston, Jump Diffusion	Interest rate curves, underlying asset spot rate, expected dividends, underlying asset volatility and correlation between underlying assets, "quanto" volatility and correlations
Inflation	Bifactorial Inflation	Nominal and inflation interest rate curves, interest and inflation rate volatility, seasonality ratios of consumer price index, correlation between inflation rates
Commodity	Net present Value Commodity, Generalised Black- Scholes, Independent Forward	Interest rate curves, spot rate, forwards and futures of underlying assets, underlying asset volatility and correlation between underlying assets, "quanto" volatility and correlations
Loans	Net present Value, Black Model	Probability of default, Recovery rate.

As envisaged by IFRS 13, in determining fair value, the Intesa Sanpaolo Group also takes into account the effect of non-performance risk. This risk includes changes in the counterparty credit rating and changes in the issuer's own credit risk.

For derivatives in particular, the Bilateral Credit Value Adjustment (bCVA) model fully takes into account the effects of changes in the counterparty credit rating, as well as changes in its own credit rating. In fact, the bCVA consists of the sum of two addends, calculated by considering the possibility that both counterparties go bankrupt:

- the CVA (Credit Value Adjustment) is a negative measure that takes into account scenarios whereby the counterparty becomes insolvent before the bank and the bank has a positive exposure to the counterparty. In these scenarios the bank suffers a loss equal to the cost of replacing the derivative;
- the DVA (Debt Value Adjustment) is a positive measure that takes into account scenarios whereby the bank becomes insolvent before the counterparty and has a negative exposure to the counterparty. In these scenarios the bank achieves a gain equal to the cost of replacing the derivative.
 - The bCVA depends on the exposure, probability of default and the Loss Given Default of the counterparties. Lastly, the bCVA must be calculated taking into account any counterparty risk mitigation agreements, particularly collateral and netting agreements for each individual counterparty. In the event of netting agreements with a specific counterparty, the bCVA is calculated with regard to the portfolio including all transactions subject to netting with that counterparty.
 - The measurement of creditworthiness uses various sources. Specifically:
- in the case of counterparties with CDS spread quoted on the market (including Intesa Sanpaolo), calculation of the bCVA is carried out by considering the neutral probability of default towards risk (namely estimated based on the prices of bonds and not on historical figures) quoted on the market and regarding both the counterparty and the investor, measured on the basis of the listed CDS spread credit curve;
- for Large Corporate counterparties without CDS quoted on the market with significant turnover, the bCVA is calculated by considering the neutral probability of default towards risk of a counterparty associated to the counterparty to the contract (comparable approach). Creditworthiness is measured:
 - o for Project Finance counterparties, using the comparable Industrial CDS spread credit curve;
 - o for other counterparties, using the comparable CDS spread credit curve for the counterparty;
- for illiquid counterparties not included in the above categories, the bCVA is calculated by considering the probability of default of the counterparty and of the Intesa Sanpaolo Group, determined by using the credit curve obtained by the default probability matrices.

On the other hand, for counterparties in default, an estimate of the counterparty risk consistent with the provisioning percentage applied to on-balance sheet exposures is carried out.

The prior Credit Risk Adjustment (CRA) calculation model is still valid for a number of products for which the bCVA model is still under development.

III. Valuation model for structured credit products

Regarding ABSs, if significant prices are not available, valuation techniques are used that take into account parameters that can be gathered from an active market (level 2 inputs) or, where parameters cannot be observed, estimated parameters (level 3 inputs, where significant).

In this case, the cash flows are obtained from info providers or specialised platforms; the spreads are gathered from prices available on the market/consensus platforms, further strengthened by a qualitative analysis relative to the performance of the underlying assets presumed from periodic investor reports and aimed at highlighting structural aspects that are not (or not fully) encompassed by the analyses described above, relating to the actual future ability to pay the expected cash flows and analyses of relative value with respect to other similar structures. The results of these analyses are subject to backtesting with actual sales prices.

In the case of CLO HY loans, valuation techniques call for calculation of the net present value of the expected cash flows, determined through specialised platforms, discounted using market spreads. When modelling expected future flows, account is taken of all contractual aspects of the CLO HY loans that may influence the waterfall (e.g. par value test, deferred interest, etc.). For this asset class, the process of determining fair value also involves stress of the main unobservable variables and a credit analysis aimed at identifying any weaknesses of the individual assets securing the CLOs that results in a revision of the input parameters.

With regard to debt securities and complex credit derivatives (funded and unfunded CDOs) the fair value is determined based on a quantitative model which estimates joint losses on collateral with a simulation of the relevant cash flows which uses copula functions.

The most significant factors considered in the simulation – for each collateral – are the risk-neutral probability of default derived from market spreads, recovery rates, the correlation between the value of collateral present in the structure and the expected residual life of the contract.

For spreads, the valuation process incorporates, as promptly as possible, all the market inputs (including synthetic indexes such as LCDX, Levx and CMBX) considered to be significant: consensus parameters calculated by multi-contribution platforms and market spread estimates made available by major dealers are used.

The Market Data Reference Guide, which sets out credit spread contribution sources, was moreover integrated with specific policies for the other inputs such as correlations and recovery rates.

For specific types of collateral, such as trust preferred securities, the probability of default is estimated using the Expected Default Frequency from Moody's - KMV.

In order to incorporate high market dislocation and intense market illiquidity phenomena in valuations, a series of corrections have been prepared for valuations referred to the main input parameters; in particular:

- stress of recovery rates: expected recovery rates on the assets held as collateral in every deal have been decreased by 25% (50% for REITS underlying securities);
- stress of asset value correlation: inter and intra correlations have been increased and decreased by 15% or 25% depending on the type of product;
- stress of spreads: the spreads, used to determine the marginal distributions of defaults, have been increased by 25%;
- stress of expected residual lives: the latter have been increased by 1 year.

Each of these modules contributes to the definition of a sensitivity grid of the value to the single parameter; results are then aggregated assuming independence between the single elements.

After this valuation, credit analyses on underlying assets were fine-tuned to incorporate further valuation elements not included in the quantitative models. In particular, a Qualitative Credit Review is provided for and entails an accurate analysis of credit aspects referred to the specific structure of the ABS/CDO and to the collateral present. This is to identify any present or future weaknesses which emerge from the characteristics of the underlying assets, which could have been missed by rating agencies and as such not fully considered in the valuations described in the previous point. The results of this analysis are condensed in certain objective elements (such as Past Due, Weighted Average Delinquency, etc.) which are summarised in an indicator representing credit quality. On the basis of the value of this synthetic indicator, specific thresholds have been identified which

correspond to a number of downgrades, so as to proceed to a consistent adjustment in the valuation. Lastly, for this class of products, an additional adjustment may be applied, subject to an authorisation procedure that, above a certain warning threshold, involves both the area of the Chief Risk Officer and the Manager responsible for preparing the Company's financial reports.

With respect to credit derivatives on index tranches, off-the-run series are valued at level 3 when no reliable and verifiable quotes are available from the Financial and Market Risks Department. Fair value is determined based on the quotes of series being issued, adjusted to reflect the different underlying.

IV. Valuation of equities with relative and absolute models

Financial instruments for which fair value is determined using level 2 inputs also include equities measured based on direct transactions, that is significant transactions on the stock registered in a time frame considered to be sufficiently short with respect to measurement date and in constant market conditions, using, therefore, the "relative" valuation models based on multipliers. Multipliers are used under the comparable companies' or comparable transactions' approach. In the former case, reference is made to a sample of comparable listed companies, therefore the stock prices from which the multiples to measure the investment are deducted. In the latter case, reference is made to the trading prices of the market related to comparable companies registered in a time frame considered to be sufficiently short with respect to measurement date and in constant market conditions.

Equities to which the above "relative" models are not applied are valued using "absolute" valuation models. In particular, these models are based on flows which substantially anticipate the measurement of the stock value by estimating the cash flows it can generate over time, discounted using a rate that is in line with the risk level of the instrument, equity models or equity-income models.

V. The valuation model for hedge funds

The determination of the fair value of a hedge fund is the result of an analytical process that involves two distinct approaches applied respectively to funds managed through the use of a Management Account Fund infrastructure and funds not managed according to such a platform.

For the funds managed in the Managed Account platform, which ensures full daily transparency of the assets underlying the funds, the NAV provided by the Fund Administrator is considered as fair value of the fund. It is not deemed necessary to apply the two prudential adjustments described above to the NAV, since:

- o the adjustment for counterparty risk is not necessary because the Managed Account platform is subject to limited recourse clauses and non-petition provisions, through which each Managed Account Fund achieves contractual separation/segregation of assets and manager. Intesa Sanpaolo effectively holds 100% of the quotas of the MAF;
- the adjustment for illiquidity risk is not necessary because there is a delivery in kind clause, according to which the fund's assets may be transferred to Intesa Sanpaolo's books and liquidated, where necessary.

Moreover, a due diligence confirmed that the valuation model used by the Fund Administrator is consistent with the Intesa Sanpaolo's Fair Value Policy.

If the daily full transparency analysis were to bring to light additional elements of risk, mark-to-market adjustments would be applied in accordance with Intesa Sanpaolo's Fair Value Policy.

The platform's characteristics make it possible to perform an analysis of the financial instruments underlying the funds and to assign the fair value hierarchy level based on prevalence, in terms of percentage of NAV, of the weight of assets priced according to the various levels.

For funds not managed in the Managed Account platform, the operational NAV provided by the Fund Administrator is used. However, this value may be prudentially adjusted by the Financial and Market Risks Department, during the valuation of inventories for accounting purposes, on the basis of an individual valuation process aimed at verifying specific idiosyncratic risks, mainly identified as follows:

- counterparty risk;
- illiquidity risk.

Specifically, the first risk driver – counterparty risk - relates to the risk that the assets of the fund are exposed to when a single service provider is entrusted with prime brokerage or custodian activities,

which is a potential source of risk in case of default. The resulting prudential adjustment to the operational NAV differs according to whether this activity is concentrated in a single name or is diversified across several service providers.

With regard to the illiquidity drivers, these relate to the risk intrinsic to the valuation of the fund assets; therefore, the prudential adjustment is applied based on the availability of prices or certain weaknesses in the valuation policies used by the fund.

The application of the foregoing prudential adjustments (counterparty risk and illiquidity risk) is subject to an authorisation procedure that, above a certain warning threshold, involves both the area of the Chief Risk Officer and the Manager responsible for preparing the Company's financial reports.

VI. Other level 2 and 3 valuation models

Loans are included among financial instruments whose fair value is determined on a recurring basis through level 2 inputs. In particular, for medium- and long-term assets and liabilities measurement is carried out by discounting future cash flows. This is based on the discount rate adjustment approach, in which the risk factors connected to the granting of loans are taken into consideration in the rate used to discount future cash flows.

As required by IFRS 13, the table below highlights, for financial assets and liabilities measured at level 3 fair value, quantitative information on the significant, unobservable inputs used in the fair value measurement.

							ousands of euro)
Financial assets/ liabilities	Valuation technique	Main non-observable input	Minimum value of range of changes	Maximum value Unit of range of changes			Unfavourable changes in FV
Securities	Discounting Cash Flows	Credit Spread	-23	31	%	8,237	-6,929
Structured securities	Two-factor model	Correlation	-31	12	%	294	-531
ABS	Discounting Cash Flows	Credit Spread	-30	42	%	1,166	-1,789
ABS	Discounting Cash Flows	Recovery rate	-25	10	%	1,394	-3,486
CLO Cash	Discounting Cash Flows	Credit Spread	-29	28	%	4,254	-4,165
CLO Cash	Discounting Cash Flows	Recovery rate	-25	10	%	15	-38
CLO Cash	Discounting Cash Flows	CPR	-10	10	%	1,131	-1,131
CDO	Gaussian copula	Credit Spread	-25	25	%	924	-924
CDO	Gaussian copula	Joint default correlation	-10	10	%	78	-78
CDO	Gaussian copula	Recovery rate	-25	10	%	248	-620
OTC derivatives subject to FV adjustment for CVA/DVA - Non-performing counterparies	bCVA	Loss Given Default Rate (LGD)	0.00	100.00	%	13,846	-20,373
OTC derivatives subject to FV adjustment for CVA/DVA - Performing counterparies	bCVA	Probability of default (PD) based on counterparty's internal rating	ccc	BBB Internal	rating	416	-159
OTC derivatives - Equity basket option	Black - Scholes model	Correlation between underlying equity baskets	2.75	96	%	612	-354
OTC derivatives - Spread option on swap rates	Lognormale bivariato model	Correlation between swap rates	-10.78	97	%	2,848	-3,626
OTC derivatives - Equity option	Black - Scholes model	Historical volatility - EuroClass	35.45	76	%	1,712	-729

Section 12 – Operational risk

Qualitative disclosure

Methods for calculating Operational Risk

On 31 December 2009, the Group adopted the Advanced Measurement Approach (AMA - internal model), in partial use with the standardised (TSA) and basic approaches (BIA) to determine the associated capital requirement for regulatory purposes. The AMA approach was adopted by the leading banks and companies in the Banca dei Territori, Corporate and Investment Banking, Private Banking and Asset Management Divisions, by the Intesa Sanpaolo Group Services consortium, by VUB Banka (including Consumer Financial Holding and VUB Leasing) and PBZ Banka.

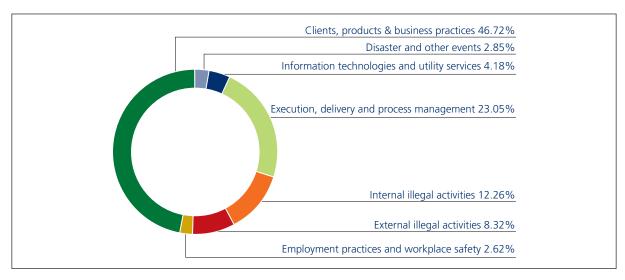

Breakdown of capital requirements by Calculation approach

(millions of euro)

	(
Approach	Capital
	requirement
Advanced Measurement Approach (AMA)	1,375
Traditional Standardised Approach (TSA)	232
Corporate Finance	7
Trading & Sales	17
Retail Banking	116
Commercial Banking	69
Payment & Settlement	16
Agency Services	2
Asset Management	4
Retail Brokerage	1
Basic Indicator Approach (BIA)	45
Total as at 31.12.2015	1,652
Total as at 31.12.2014	1,693

The following shows the breakdown of capital requirement relating to the Advanced AMA Approach by type of event.

The internal model for calculating capital absorption is conceived in such a way as to combine all the main sources of quantitative (operational losses) and qualitative (Self-diagnosis) information.

The quantitative component is based on an analysis of historical data concerning internal events (recorded by organisational units, appropriately verified by the Head Office Department and managed by a dedicated IT system) and external events (by the Operational Riskdata eXchange Association).

The qualitative component (scenario analysis) focuses on the forward-looking assessment of the risk exposure of each unit and is based on the structured, organised collection of subjective estimates expressed directly by management (subsidiaries, Parent Company's business areas, the Corporate Centre) with the objective of assessing the potential economic impact of particularly severe operational events.

Capital-at-risk is therefore identified as the minimum amount at Group level required to bear the maximum potential loss (worst case); Capital-at-risk is estimated using a Loss Distribution Approach model (actuarial statistical model to calculate the Value-at-risk of operational losses), applied on quantitative data and the results of the scenario analysis assuming a one-year estimation period, with a confidence level of 99.90%; the methodology also applies a corrective factor, which derives from the qualitative analyses of the risk level of the business environment (Business Environment Assessment), to take into account the effectiveness of internal controls in the various organisational units.

In addition, the Group activated a traditional operational risk transfer policy (to protect against offences such as employee disloyalty, theft and damage, cash and valuables in transit losses, computer fraud, forgery, cyber crimes, earthquake and fire, and third-party liability), which contributes to mitigating exposure to operational risk. At the end of June 2013, in order to allow optimum use of the available operational risk transfer tools and to take advantage of the capital benefits, pursuant to applicable regulations the Group stipulated an insurance coverage policy named Operational Risk Insurance Programme, which offers additional coverage to traditional policies, significantly increasing the limit of liability, transferring the risk of significant operational losses to the insurance market.

The internal model's insurance mitigation component was approved by the Bank of Italy in June 2013 with immediate effect of its benefits on operations and on the capital requirements.

In addition, with respect to risks relating to real property and infrastructure, with the aim of containing the impacts of phenomena such as catastrophic environmental events, situations of international crisis, and social protest events, the Group may activate its business continuity solutions.

Section 13 - Equity Exposures: disclosures for positions not included in the trading book

Oualitative disclosure

Equity exposures not included in the trading book: differentiation between exposures according to the objectives pursued

The investments in equities present in the Banking Group have a variety of functions:

- strategic: companies subject to significant influence, joint ventures with industry partners and institutional investments;
- instrumental to the Bank's business and the development of commercial operations;
- systemic institutional: investments in public finance, consortium companies, and local bodies and institutions;
- financial investment: especially private equity investments.

Recognition and valuation of the equity instruments not included in the trading book

As set forth by Legislative Decree 38 of 28 February 2005, the Intesa Sanpaolo Group's Consolidated financial statements have been prepared in compliance with the accounting principles issued by the International Accounting Standards Board (IASB) and the relative interpretations of the International Financial Reporting Interpretations Committee (IFRIC) and endorsed by the European Commission as provided for by Community Regulation 1606 of 19 July 2002.

The Consolidated financial statements as at 31 December 2015 have been prepared based on the "Instructions for the preparation of the separate and consolidated financial statements of banks and financial companies, which are parent companies of banking groups" issued by the Bank of Italy (circ. 262/05) in the exercise of powers set forth by Art. 9 of Legislative Decree 38/2005.

These Instructions set out compulsory financial statement forms, as well as the contents of the Notes to the financial statements.

The equity exposures not included in the trading book are classified under the balance sheet items Investments in subsidiaries, associates and companies subject to joint control and Assets available for sale. They are not, however, except for marginal amounts, included within the Financial assets designated at fair value through profit and loss, because the Intesa Sanpaolo Group essentially classifies investments against insurance policies in this category (not included in the scope of this disclosure), and certain debt securities with embedded derivatives or debt securities subject to financial hedging.

Therefore, for an explanation of the methods for the recognition and measurement of the equity instruments not included in the trading book, please refer to Part A of the Notes to the consolidated financial statements - Accounting Policies which sets out, for each individual financial statement caption, the accounting criteria applied by the Intesa Sanpaolo Group (A.2 - MAIN FINANCIAL STATEMENT CAPTIONS). In particular, paragraphs 2, 5 and 7 set out the criteria for classification, recognition, measurement and derecognition for "Financial assets available for sale", "Financial assets designated at fair value" and "Investments in subsidiaries, associates and companies subject to joint control" respectively; point 19 shows the Methods for determining impairment losses both for financial assets and for investments. For details on the criteria for impairment testing of financial assets available for sale and of investments in subsidiaries, associates and companies subject to joint control, reference should be made to Part B of the Notes to the consolidated financial statements (SECTION 4 - FINANCIAL ASSETS AVAILABLE FOR SALE and SECTION 10 - INVESTMENTS IN SUBSIDIARIES, ASSOCIATES AND COMPANIES SUBJECT TO JOINT CONTROL). Lastly, for a description of the valuation techniques used to calculate fair value, see the discussion of this subject in the section on market risks of this document.

Quantitative disclosure

The tables below show the breakdown of the equity exposures according to their book classification. The figures represent the exposures shown in the Group consolidated financial statements and exclude the values of all investments in fully consolidated companies. The value of investments in insurance companies, which is deducted from the regulatory capital, is shown in the Section on Own funds.

C. Financial assets designated at fair value through profit and loss (DAAFV)	-	-	-	-	-	-	×	X

 $[\]ensuremath{^{(*)}}$ This table provides figures pertaining exclusively to the Banking Group.

Price risk generated by minority stakes in quoted companies, mostly held in the AFS (Available for Sale) category and measured in terms of VaR, recorded an average level during 2015 of 37 million euro (30 million euro at the end of 2014), with peak and minimum values of 52 million euro and 22 million euro respectively (27 million euro at the end of 2015).

Lastly, the table below shows a sensitivity analysis of the banking book to price risk, measuring the impact on Shareholders' Equity of a price shock of $\pm 10\%$ for the abovementioned quoted assets recorded in the AFS category.

Non-trading book: impact on shareholders' equity of price risk as at 31 December 2015

(millions of euro)

		Impact on shareholders' equity
Price shock	+10%	4
Price shock	-10%	-4

 $^{^{(\}star\star)}$ For Investments, the fair value refers to listed investments only (level 1).

Non-trading book: on-balance sheet equity exposures - weighted values

(millions of euro)

	Weighted exposure		
	31.12.2015		31.12.2014
IRB approach	4,112		4,192
Equity exposures (Simple risk weight approach)			
- Private equity exposures in sufficiently diversified portfolios	41	-	83
- Exchange-traded equity exposures	465	-	581
- Other equity exposures	2,005	-	1,951
Equity exposures (PD/LGD approach)	-	-	-
Equity exposures (Exposures subject to fixed weighting factors)	1,601	-	1,577
Standardised approach	11,661	-	12,882

Section 14 – Interest rate risk on positions not included in the trading book

Qualitative disclosure

Interest rate risk

Interest rate risk originated by the banking book arises primarily in the Parent Company and in the other Group Companies that carry out retail and corporate banking and represents the risk that potential variations in the rates will have an impact on the interest margin and on the net present value of the assets and liabilities included within the banking book.

As already mentioned in Section 1 – General requirements of this disclosure, two types of measurement have been adopted for the consolidated measurement of the financial risks generated by the banking book, at least monthly, namely Value at Risk (VaR) and Sensitivity analysis.

In addition to being used to measure the price and exchange risks generated by the equity investments, the VaR is also used to consolidate exposure to financial risks of the various Group companies that perform banking book activities, thereby taking into account diversification benefits.

The shift sensitivity analysis, with reference to the interest rate risk, defines the movement as a parallel and uniform shift of ± 100 basis points of the rate curve.

In measurements, capital items are represented as "to maturity" or "repricing" depending on whether they involve a fixed or variable rate, except for categories of instruments whose risk profiles are different from those contractually envisaged. In this respect, therefore, the choice was made to use a behavioural representation to calculate the risk measures. More specifically:

- for mortgages, statistical techniques are used to determine the probability of prepayment, in order to reduce the Group's exposure to interest rate risk (overhedging) and to liquidity risk (overfunding);
- for core deposits, a financial representation model is adopted aimed at reflecting the behavioural features of stability of deposits and partial and delayed reaction to market interest rate fluctuations, in order to stabilise the interest margin both in absolute terms and in terms of variability over time;
- for the expected loss on loans, which represents the average cost of long-term loans, a shift in the
 discounting curve is envisaged, according to the aggregate credit risk levels by economic segment, in
 order to reduce this component in the cash flows.

The sensitivity of the interest margin is measured on the basis of a parallel and instantaneous shock in the interest rate curve of 100 basis points, over a period of 12 months. It should be noted that this measure highlights the effect of variations in market interest rates on the portfolio being measured, and excludes assumptions on future changes in the mix of assets and liabilities and, therefore, it cannot be considered as a predictor of the future levels of the interest margin.

The Group's overall financial risk profile and the eventual necessary changes are examined periodically by the Group Financial Risks Committee.

Quantitative disclosure

Interest rate risk

Interest margin sensitivity – assuming a 100 basis point change in interest rates – amounted to 535 million euro at the end of 2015, up compared to the 217 million euro at the end of 2014.

In the case of invariance of the other income components, the aforesaid potential impact would be reflected also in the Group's year-end net income and taking into account the abovementioned assumptions concerning the measurement procedures.

In 2015, interest rate risk generated by the Intesa Sanpaolo Group's banking book, measured through shift sensitivity analysis, averaged 338 million euro, with a year-end figure of 547 million euro compared to the 190 million euro at the end of 2014.

The table below shows, in absolute terms, the impact on the banking book of the 100bp shock, broken down into the main currencies that the Intesa Sanpaolo Group is exposed to.

(millions of euro)

		31.12.2015
EUR	Euro	626
CHF	Swiss Franc	25
USD	US Dollar	21
EGP	Egyptian Pound	17
	Other currencies	16

Interest rate risk, measured in terms of VaR, averaged 53 million euro in 2015, with a minimum value of 10 million euro and a maximum value of 139 million euro, the same level as at the end of 2015 (11 million euro at the end of 2014).

The reduction in the economic value in the event of a 200 bp change in interest rates stayed within the limits of the alert threshold set by the prevailing Regulatory provisions (20% of Own Funds).

Section 15 - Encumbered and Unencumbered assets

Oualitative disclosure

In the course of its operations, the Intesa Sanpaolo Group carries out a number of transactions involving the encumbrance of own assets or assets received as collateral. Among the main transactions of this type are:

- repurchase agreements and securities lending;
- assets used against covered bond issues;
- underlying assets of securitisation structures, in which the financial assets have not been derecognised;
- collateralisation agreements such as, for example, collateral given in respect of the market value of derivatives;
- collateralised financial guarantees;
- collateral deposited with clearing systems, with central counterparties (CCPs) and other infrastructure institutions as a condition for access to the service; this includes incremental and initial margins;
- instruments given as collateral in several respects, for funding from central banks or multilateral development banks.

These types of activities are carried out either to allow the Group to access forms of funding considered favourable at the time a transaction is finalised or because the provision of collaterals is the standard condition to access specific markets or types of activities (for example, in transactions with central counterparties). In particular, the guarantees provided in connection with the refinancing operations at the European Central Bank amount to approximately 37 billion euro for the owned assets recorded and to approximately 1 billion euro for the assets not recognised in the financial statements.

As a rule, transactions involving encumbered assets are carried out mainly by the Parent Company or by Banca IMI. The Group's network banks took part in the pooling of assets against the provision of covered bond issues. The issue of covered bonds is also dealt with in depth in the Notes to the consolidated financial statements, under the specific point of Part E: "Covered bond transactions".

Quantitative disclosure

Based on the regulations issued by the EBA as a result of the provisions of the CRR (art. 433), the institutions must indicate the amount of encumbered or unencumbered assets by type of activity. "Encumbered" assets are on-balance sheet assets that have been provided as pledge or sold not derecognised, or otherwise encumbered, as well as the guarantees received that meet the conditions for recognition in the financial statements of the transferee. Starting from this disclosure as at 31 December 2015, the information published on the subject of encumbered and unencumbered assets are calculated based on median valuesof quarterly data on a rolling basis during the previous twelve months. Information published in Pillar 3 of financial year 2014, exhibited as comparison, did, on the other hand, refer to accurate figures as at 31 December 2014, as they relate to the first period of entry into force of the new prudential regulations on Asset encumbrance.

Encumbered and unencumbered assets as at 31 December 2015

(millions of euro)

	Encumbere	Encumbered assets		red assets
	Book value	Fair value	Book value	Fair value

Liabilities associated to encumbered assets, collateral received or own securities	101,618	126,667

Section 16 - Leverage Ratio

Qualitative and quantitative disclosure

Under the Basel 3 prudential regulations, the Leverage ratio entered definitively into effect on 1 January 2015. The Leverage ratio measures the degree to which Tier 1 Capital covers the Banking Group's total exposure. The ratio is calculated by considering assets and off-balance sheet exposures. The objective of the indicator is to contain the degree of indebtedness on banks' accounts by establishing a minimum level of coverage of exposures with equity. The ratio, which is monitored by the authorities, is expressed in percent form and is subject to a regulatory minimum threshold of 3% (the Basel Committee's reference value).

The leverage ratio is one of the measurement criteria selected within the scope of the Risk Appetite Framework for the monitoring of the overall risk and, more specifically, of the Group's capital adequacy. In line with the previous year, the 2015 RAF update confirmed the choice to define its limits by adding to the regulatory minimum of 3% a stress buffer (calculated considering a stress scenario with a 1/40 probability). Moreover, an Early Warning threshold has been added, with an additional prudential buffer.

The leverage ratio is calculated quarterly. The indicator is monitored at both the individual and Banking Group level.

The Capital Requirement Regulation (CRR - Regulation 575/2013) grants the Supervisory Authorities of individual countries the right to exercise "national discretion," on the basis of which, inter alia, during the period from 1 January 2015 to 31 December 2017, the Leverage ratio may be calculated at the end of the quarter, instead of using the simple arithmetic mean of monthly leverage ratios over the quarter of reference. Since the Bank of Italy has exercised the above-mentioned national discretion (see Circular 285), the Intesa Sanpaolo Group's Leverage ratio set out below has been calculated in reference to quarter-end data.

In further detail, the Leverage ratio is calculated as the ratio of Tier 1 Capital to total exposure. Focusing on the denominator of the ratio, total exposure includes on-balance sheet exposures, net of any components deducted from Tier 1 Capital, and off-balance sheet exposures (guarantees and commitments, derivatives, securities financing transactions and transactions with long-term settlement).

During the period from 1 January 2015 to 31 December 2021, the Leverage ratio will be calculated and reported using both of the following elements as capital measures:

- "transitional" Tier 1 Capital, i.e. the sum of the entity's Common Equity Tier 1 (CET1) Capital and Additional Tier 1 (AT1) Capital;
- "full phase-in" Tier 1 Capital, i.e. not including the derogations under the transitional provisions and the grandfathering clauses for capital instruments.

The Delegated Act of the Commission of 10 October 2014 (which became Regulation EU No 62/2015) was published in the Official Journal of the European Union on 17 January 2015. In the delegated act, which amends Regulation 575/2013 (the CRR), the European Commission provides indications aimed at ensuring the consistency of the various interpretations of the methods for calculating the Leverage ratio that make the indicators calculated by the various institutions not comparable with one another.

The main changes introduced by the Delegated Act, compared to the CRR regulation in force, impact on the exposure value, including, in particular:

- for derivatives, the possibility of deducting from the exposure value the variation margin in cash, if certain conditions laid down by the Delegated Act are met;
- measurement of credit derivatives sold at their notional gross amount rather than at fair value, with the possibility of deducting from the notional amount the changes in the fair value recognized through profit and loss (as negative components). When strict criteria are complied with, the offsetting of the protection sold with the protection purchased is also authorised;

- deduction from exposures of the "customer" component of transactions with a qualifying central counterparty (QCCP) where the entity is not obliged to reimburse the customer in the event of default of the QCCP, because no leverage effect is created;
- clarification that the collateral received for securities financing transactions cannot be used to reduce
 the exposure value of those transactions, but that receivables and payables in cash arising from such
 transactions with the same counterparty may be offset when strict criteria are met.

On 15 June 2015 the EBA published the new reporting standards (ITS - Implementing Technical Standards) which implement the changes introduced by the Delegated Act; these standards will become effective six months after their adoption by the European Commission. Until the entry into force of the new ITS, it is expected that the Bank continues to report the index without the amendments introduced by the Delegated Act.

On 15 February 2016, Commission Implementing Regulation 2016/200 was published in the Official Journal of the European Union laying down implementing technical standards with regard to the disclosure on the Leverage Ratio, under EU Regulation 575/2013.

Leverage ratio of the Intesa Sanpaolo Group

The following is a summary of the data relating to the calculation of the Intesa Sanpaolo Group's Leverage ratio as at 31 December 2015, in compliance with reporting requirements. The ratio is expressed in percent form and is subject to the regulatory minimum threshold of 3% (the Basel Committee reference value).

Limited assurance report on the Basel 3 Pillar 3 - Disclosure

To the management board of Intesa Sanpaolo S.p.A.

- We have reviewed the Basel 3 Pillar 3 Disclosure (the "Pillar 3") of the Intesa Sanpaolo Group at 31 December 2015. The parent's management board is responsible for the preparation of the Pillar 3 in accordance with the provisions of Circular no. 285 of 17 December 2013 and subsequent amendments. It is also responsible for establishing and maintaining appropriate performance management and internal control processes for the preparation of the data and information contained in the Pillar 3. Our responsibility is to issue this report based on our review.
- We carried out our review in accordance with International Standard on Assurance Engagements 3000 Assurance Engagements other than Audits or Reviews of Historical Financial Information (ISAE 3000), issued by the International Auditing and Assurance Standards Board (IAASB). This Standard requires that we comply with applicable ethical requirements (the "Code of Ethics for Professional Accountants" issued by the International Federation of Accountants, IFAC), including independence requirements, and that we plan and perform the engagement to obtain limited assurance about whether the Pillar 3 is free from material misstatement.

Specifically, we carried out the following procedures:

- comparing the information and data presented in the Pillar 3 to the corresponding
 information and data included in the Intesa Sanpaolo Group's consolidated financial
 statements as at and for the year ended 31 December 2015, on which we issued our
 report dated 3 March 2016 pursuant to articles 14 and 16 of Legislative decree no.
 39 of 27 January 2010;
- interviews and discussions with the management of Intesa Sanpaolo S.p.A. and the
 main banks included in the "Banking Group" as defined in Section 2 of the Pillar 3,
 to gather information on the IT, accounting and reporting systems used in preparing
 the Pillar 3, and on the processes and internal control procedures used to gather,
 combine, process and transmit data and information to the manager in charge of
 financial reporting for the preparation of the Pillar 3;
- sample-based analyses of documentation supporting the preparation of the Pillar 3 to
 obtain evidence of the processes put in place to prepare the data and information
 presented therein;

Codice Fiscale N. 00709600159
R.E.A. Milano N. 512867
Pariita IVA 00709600159
VAT number IT00703600159
Sede legale: Via Vittor Pisani, 25
20124 Milano MI ITALIA

- reading correspondence with Banca d'Italia in relation to the authorisation process related to using internal systems in calculating capital requirements;
- reading the reports issued by the Internal Auditing and Internal Validation departments on the management and internal control processes relevant for the preparation of the data and information presented in the Pillar 3;
- obtaining the representation letter on the compliance of the Pillar 3 with Circular no. 285 of 17 December 2013 and subsequent amendments and on the reliability and completeness of the information and data contained therein.

A review is less in scope than an audit carried out in accordance with ISAE 3000 and, therefore, it offers a lower level of assurance that we have become aware of all significant matters and events that would be identified during an audit.

The Pillar 3 includes the corresponding information and data of the prior year Pillar 3 for comparative purposes, with respect to which reference should be made to our report dated 16 March 2015.

- Based on our review, nothing has come to our attention that causes us to believe that the Pillar 3 of the Intesa Sanpaolo Group at 31 December 2015 is not prepared, in all material respects, in accordance with the provisions of Circular no. 285 of 17 December 2013 and subsequent amendments.
- This report has been prepared for the management board of Intesa Sanpaolo S.p.A. in compliance with our engagement. We carried out our work for the purposes of informing Intesa Sanpaolo S.p.A. of the matters contained herein. Therefore, we have no responsibility to any party other than Intesa Sanpaolo S.p.A. in relation to the work performed, this report or the conclusions expressed herein.

Milan, 15 March 2016

Own funds: Transitional own funds disclosure template

			Amount at disclosure date	(millions of euro) Amounts subject to pre-Regulation (EU) No 575/2013 treatment or prescribed residual amount of Regulation (EU) No 575.2013
Comr	non I	Equity Tier 1 (CET1) capital: instruments and reserves		
1		Capital instruments and the related share premium accounts	35,596	
		of which: Ordinary shares	35,596	
2		Retained earnings	9,160	
3		Accumulated other comprehensive income (and other reserves, to include unrealised gains and losses under the applicable accounting standards)	-1,018	
3a		Funds for general banking risk	-	
4		Amount of qualifying items referred to in Article 484 (3) and the related share premium accounts subject to phase-out from CET1 capital	-	
		Public sector capital injections grandfathered until 1 January 2018	-	
5		Minority interests (amount allowed in consolidated CET1)	151	112
5a		Independently reviewed interim profits net of any foreseeable charge or dividend	356	
6		Common Equity Tier 1 (CET1) capital before regulatory adjustments	44,245	
Comr	non I	Equity Tier 1 (CET1) capital: regulatory adjustments		
7		Additional value adjustments (negative amount)	-132	
8		Intangible assets (net of related tax liability) (negative amount)	-7,039	
9		Transitional adjustment related to IAS 19	339	
10		Deferred tax assets that rely on future profitability excluding those arising from temporary differences (net of related tax liability where the conditions in Article 38 (3) are met) (negative amount)	-85	-214
11		Fair value reserves related to gains or losses on cash flow hedges	1,145	
12		Negative amounts resulting from the calculation of expected loss amounts	-120	-299
13		Any increase in equity that results from securitised assets (negative amount)	0	
14		Gains or losses on liabilities valued at fair value resulting from changes in own credit standing	40	
15		Defined-benefit pension fund assets (negative amount)	0	
16		Direct and indirect holdings by the institution of own CET1 instruments (negative amount)	-68	
17		Holdings of the CET1 instruments of financial sector entities where those entities have reciprocal cross holdings with the institution designed to inflate artificially the own funds of the institution (negative amount)	-	
18		Direct and indirect holdings by the institution of the CET1 instruments of financial sector entities where the institution does not have a significant investment in those entities (amount above the 10% threshold and net of eligible short positions) (negative amount)	-	
19		Direct, indirect and synthetic holdings by the institution of the CET1 instruments of financial sector entities where the institution has a significant investment in those entities (amount above the 10% threshold and net of eligible short positions) (negative amount)	-543	
20		[not relevant in EU regulation]	-	
20a		Exposure amount of the following items which qualify for a risk weighting of 1250%, where the institution opts for the deduction alternative	-	
	20b	of which: qualifying holdings outside the financial sector (negative amount)	-	
	20c	of which: securitisation positions (negative amount)	-	
	20d	of which: free deliveries (negative amount)	-	
21		Deferred tax assets arising from temporary differences (amount above the 10% threshold, net of related tax liability where the conditions in Article 38 (3) are met) (negative amount)	-	

				Amounts subject to pre-Regulation (EU) No 575/2013 treatment or prescribed residual amount of Regulation (EU) No 575.2013
22		Amount exceeding the 15% threshold (negative amount)	-	
	23	of which: direct and indirect holdings by the institution of the CET1 instruments of financial sector entities where the institution has a significant investment in those entities	-	
24		Deferred tax assets	-	
	25	of which: deferred tax assets arising from temporary differences	-	
25a		Losses for the current financial year (negative amount)	-	
25b		Foreseeable tax charges relating to CET1 items (negative amount)	-	
26		Regulatory adjustments applied to CET1 in respect of amounts subject to pre-CRR treatment	-319	
26a		Regulatory adjustments relating to unrealised gains and losses pursuant to Articles 467 and 468	-555	
		of which: Unrealised gains on debt securities issued by European Union central governments	-40	
		of which: Unrealised gains on debt securities of issuers other than European Union central governments	-260	
		of which: Unrealised gains on equities and quotas of UCI	-255	
26b		Amount to be deducted from or added to CET1 capital with regard to additional filters and deductions required pre-CRR	-	
		of which deduction of deferred tax assets that rely on future profitability and do not arise from temporary differences (Articles 469(1)(a), 36(1)(c) and 478(1) of the CRR)	-	
		of which deduction of negative amounts resulting from the calculation of expected loss amounts in accordance with Articles 158 and 159 of the CRR (Articles 469(1)(a), 36(1)(d) and 478(1) of the CRR)	-	
		of which deduction of the applicable amount of direct, indirect and synthetic holdings by the institution of CET1 instruments of financial sector entities where the institution has a significant investment in those entities and deferred tax assets that rely on future profitability and arise from temporary differences (Articles 469(1)(c), 36(1)(c) and (i) and 478(1) and (2) of the CRR)	-	
		of which impacts arising from deductible under transitional adjustments	_	
27		Qualifying AT1 deductions that exceed the AT1 capital of the institution (negative amount)	-	
28		Total regulatory adjustments to Common Equity Tier 1 (CET1) capital	(7,337)	
29		Common Equity Tier 1 (CET1) capital	36,908	

				Amounts subject to pre-Regulation (EU) No 575/2013 treatment or prescribed residual amount of Regulation (EU) No 575.2013
Addit	tional	Tier 1 (AT1) capital: instruments		
30		Capital instruments and the related share premium accounts	1,356	
	31	of which: classified as equity under applicable accounting standards	-	
	32	of which: classified as liabilities under applicable accounting standards	-	
33		Amount of qualifying items referred to in Article 484 (4) and the related share premium accounts subject to phase-out from AT1	1,435	
		Public sector capital injections grandfathered until 1 January 2018	-	
34		Qualifying Tier 1 capital included in consolidated AT1 capital (including minority interests not included in row 5) issued by subsidiaries and held by third parties	8	
	35	of which: instruments issued by subsidiaries subject to phase-out	-	
36		Additional Tier 1 (AT1) capital before regulatory adjustments	2,799	
Addit	tional	Tier 1 (AT1) capital: regulatory adjustments		
37		Direct and indirect holdings by an institution of own AT1 instruments (negative amount)	-	
38		Holdings of the AT1 instruments of financial sector entities where those entities have reciprocal cross holdings with the institution designed to inflate artificially the own funds of the institution (negative amount)	-	
39		Direct and indirect holdings of the AT1 instruments of financial sector entities where the institution does not have a significant investment in those entities (amount above the 10% threshold and net of eligible short positions) (negative amount)	-	
40		Direct and indirect holdings by the institution of the AT1 instruments of financial sector entities where the institution has a significant investment in those entities (amount above the 10% threshold and net of eligible short positions) (negative amount)	-	
41		Regulatory adjustments applied to Additional Tier 1 capital in respect of amounts subject to pre-CRR treatment and transitional treatments subject to phase-out as prescribed in Regulation (EU) No 575/2013 (i.e. CRR residual amounts)	-	
41a		Residual amounts deducted from Additional Tier 1 capital with regard to deduction from CET1 capital during the transitional period pursuant to Article 472 of Regulation (EU) No 575/2013	(90)	
441		of which residual amount by which expected losses exceed adjustments for IRB positions	(90)	
41b		Residual amounts deducted from Additional Tier 1 capital with regard to deduction from Tier 2 capital during the transitional period pursuant to Article 475 of Regulation (EU) No 575/2013 of which deduction of the applicable amount of direct, indirect and synthetic holdings by the institution of CET1 instruments of financial sector entities where the institution has a significant investment in those entities and deferred	(407)	
		tax assets that rely on future profitability and arise from temporary differences (Articles 469(1)(c), 36(1)(c) and (i) and 478(1) and (2) of the CRR)	(413)	
		of which impacts arising from deductible under transitional adjustments	6	
41c		Amount to be deducted from or added to Additional Tier 1 capital with regard to additional filters and deductions required pre-CRR of which: possible filter for unrealised losses	-	
		of which: possible filter for unrealised gains	_	
		of which: other filter	-	
42		Qualifying T2 deductions that exceed the T2 capital of the institution (negative amount)	-

84	Current cap on T2 instruments subject to phase-out arrangements	1,630	
85	Amount excluded from T2 due to cap (excess over cap after redemptions and maturities)	-	

Glossary

GLOSSARY

The definition of certain technical terms is provided below, in the meaning adopted in the "Pillar 3 Basel 3 disclosure" and excluding the terms today widely used in the Italian language or which are used in a context that already clarifies their meaning

AIRB (Advanced Internal Rating Based)

Approach to using internal ratings within the framework of the New Basel Accord, which provides for either the Foundation or the Advanced Approach. The Advanced Approach may be used only for certain regulatory segments by institutions meeting more stringent requirements compared to the Foundation Approach. With the Advanced Approach, banks use their own internal estimates for all inputs (PD, LGD, EAD) used for credit risk assessment, whereas for Foundation IRB they only estimate PD.

ABS – Asset-Backed Securities

Financial securities whose yield and redemption are guaranteed by a pool of assets (collateral) of the issuer (usually a Special Purpose Vehicle – SPV), exclusively intended to ensure satisfaction of the rights attached to said financial securities.

Examples of assets pledged as collateral include mortgages, credit card receivables, short-term trade receivables and auto loans.

ABS (receivables)

ABS whose collateral is made up of receivables.

AMA

(Advanced Measurement Approach) - A method for determining the operational risk capital requirements using calculation models based on operational loss data and other assessment elements collected and processed by the bank. Specific access thresholds and eligibility requirements are defined for adoption of the Standardised and Advanced approaches. For AMA systems, the requirements concern not only the management system but also the measurement system.

AT1

Additional Tier 1 (AT1) In general, the AT1 category includes equity instruments other than ordinary shares (which are eligible for Common Equity) and which meet the regulatory requirements for inclusion in that level of own funds (e.g. savings shares).

Backtesting

Retrospective analyses performed to verify the reliability of the measurement of risk sources associated with different asset portfolios.

Banking book

Usually referred to securities or financial instruments in general, it identifies the portion of a portfolio dedicated to "proprietary" trading.

Capital structure

It is the entire set of the various classes of bonds (tranches) issued by a special purpose vehicle (SPV), and backed by its asset portfolio, which have different risk and return characteristics, to meet the requirements of different categories of investors. Subordination relationships between the various tranches are regulated by a set of rules on the allocation of losses generated by the collateral:

Equity (or Junior) Tranche: The riskiest portion of the portfolio, it is also known as "first loss" and is

subordinated to all other tranches; hence, it is the first to bear the losses which might occur in the recovery of the underlying assets.

Mezzanine Tranche: The tranche with intermediate subordination level between equity and senior tranches. The mezzanine tranche is normally divided into 2-4 tranches with different risk levels, subordinated to one another. They are usually rated in the range between BBB and AAA.

Senior/Supersenior Tranche: The tranche with the highest credit enhancement, i.e. having the highest priority claim on remuneration and reimbursement. It is normally also called super-senior tranche and, if rated, it has a rating higher than AAA since it is senior with respect to the AAA mezzanine tranche.

Cap test

A test performed in respect of the originator or the promoter to establish capital requirements in securitisation transactions. Under the regulations, the risk-weighted value of all exposures in respect of a single securitisation cannot exceed the weighted value of the securitised assets, calculated as if said assets had not been securitised (cap). The capital requirement in respect of all exposures to the same securitisation is equal to 8% of the cap.

Categories of financial instruments provided for by IAS 39

Financial assets "held-for-trading", which include: any asset acquired for the purpose of selling it in the near term or part of portfolios of instruments managed jointly for the purpose of short-term profit-taking; assets designated at fair value, under the IAS, this category may include the assets that the entity decides in any case to measure at fair value with value changes recognized through profit and loss, in the cases provided for by IAS 39; financial assets "held-tomaturity", non-derivative assets with fixed-term and fixed or determinable payments, that an entity intends and is able to hold to maturity; "Loans and receivables", non-derivative financial assets with fixed or determinable payments not quoted in an active market; financial assets "available-for-sale", specifically designated as such, or, to a lesser extent, others not falling under the previous categories.

CCF - Credit Conversion Factor

For banks that use the Standardised Approach and the FIRB, the Credit Conversion Factor is the weighting provided for by the applicable regulations - applied to off-balance sheet exposures to determine their EAD:

- 100% to full-risk guarantees and commitments;
- 50% to medium-risk guarantees and commitments (e.g. margins available on irrevocable credit lines with an original maturity of more than one year);
- 20% to medium-low risk guarantees and commitments (import-export documentary credits);
- 0% to low-risk guarantees and commitments (e.g. undrawn revocable credit facilities);

Collective assessment of performing loans

With reference to a homogeneous group of regularly performing financial assets, collective assessment defines the degree of credit risk potentially associated with them, though it is not yet possible to tie risk to a specific position.

CET1

Common Equity Tier 1.

Common equity tier 1 ratio (CET1 Ratio)

The ratio of Common Equity Tier 1 (CET1) to total risk-weighted assets.

Corporate

Customer segment consisting of medium- and largesized companies (*mid-corporate and large corporate*).

Covered bond

Special bank bond that, in addition to the guarantee of the issuing bank, is also backed by a portfolio of mortgage loans or other high-quality loans sold to a special purpose vehicle.

Credit default swap/option

Contract under which one party transfers to another - in exchange for payment of a premium - the credit risk of a loan or security contingent on occurrence of a default event (in the case of an option the right must be exercised by the purchaser).

Credit derivatives

Derivative contracts for the transfer of credit risks. These products allow investors to perform arbitrage and/or hedging on the credit market, mainly by means of instruments other than cash, to acquire credit exposures of varying maturities and intensities, to modify the risk profile of a portfolio and to separate credit risks from other market risks.

Credit risk

The risk that an unexpected change in a counterparty's creditworthiness, in the value of the collateral provided, or in the margins used in case of default might generate an unexpected variation in the value of the bank's exposure.

CRM

Credit Risk Mitigation.

Cumulative loss

Cumulative loss incurred, at a certain date, on the collateral of a specific structured product.

Default

Declared inability to honour one's debts and/or make the relevant interest payments.

Delinguency

Failure to make loan payments at a certain date, normally provided at 30, 60 and 90 days.

EAD – Exposure At Default

Relating to positions on or off balance sheet, it is defined as the estimated future value of an exposure upon default of a debtor. Only banks meeting the requirements for using the AIRB approach are entitled to estimate EAD. The others are required to make reference to statutory estimates.

EDF – Expected Default Frequency

Frequency of default, normally based on a sample internal or external to the bank, which represents the average risk level associable with a counterparty.

Exotics (derivatives)

Non-standard instruments unlisted on the regular markets, whose price is based on mathematical models.

EPE

Internal model to determine the requirement for counterparty risk (Expected Positive Exposure). According to this model, the EPE is calculated as a statistical-time-based average of the future mark-to-market evolution of the derivatives, strengthened by conservative restrictions on the mark-to-market profiles that do not decrease over time

Expected loss

Amount of losses on loans or receivables that an entity could sustain over a holding period of one year. Given a portfolio of loans and receivables, the expected loss represents the average value of the distribution of losses.

Fair value

The amount at which an asset could be bought or sold or a liability incurred or settled, in a current transaction between willing parties.

FiRB

See "IRB"

Goodwill

The value attached to intangible assets as part of the purchase price of a shareholding in a going concern.

Grandfathering

The new composition of own funds according to Basel 3 and other less significant measures shall enter into force following a transitional period. Specifically, old instruments included in Basel 2 regulatory capital which are not included as per Basel 3 shall be gradually eliminated (known as the grandfathering period).

Hybrid instruments included in Tier 1 capital

Financial instruments that may be included in Tier 1 capital up to specific limits when the funding raised is available on an ongoing basis and there is an ability to absorb losses that fully guarantees the bank's capital stability. Such instruments may be classified as innovative or non-innovative depending on whether there are incentives for early redemption by the issuer (e.g., step-up clauses).

IAS/IFRS

The IAS (International Accounting Standards) are issued by the International Accounting Standards Board (IASB). The standards issued after July 2002 are called IFRS (International Financial Reporting Standards).

IASB (International Accounting Standard Board)

The IASB (previously known as the IASC) is the entity responsible for issuing international accounting standards (IAS/IFRS).

Basel 3 Pillar 3 - Glossary

ICAAP

Under the "Second Pillar" banks are required to adopt processes and instruments for implementing the Internal

Capital Adequacy Assessment Process, (ICAAP) to determine the amount of capital needed to cover all risks, including risks different from those covered by the total capital requirement ("First Pillar"), when assessing current and potential future exposure, taking into account business strategies and developments in the economic and business environment.

IFRIC (International Financial Reporting Interpretations Committee)

A committee within the IASB that establishes official interpretations of international accounting standards (IAS/IFRS).

IMA

Internal Models Approach: it can be used to calculate market risks.

Impairment

When referred to a financial asset, a situation of impairment is identified when the book value of an asset exceeds its estimated recoverable amount.

Incurred loss

Loss already inherent in a portfolio, but not yet identifiable at the level of an individual loan or receivable, also known as an "incurred but not reported loss." Loss already inherent in a portfolio, but not yet identifiable at the level of an individual loan or receivable, also known as an "incurred but not reported loss."

Intangible asset

An identifiable, non-monetary asset lacking physical substance.

IRB (Internal Rating Based)

Approach based on internal ratings within the framework of the New Basel Accord. In the internal ratings approach the expected loss on a loan portfolio is estimated through three parameters (PD, LGD and EAD). In the foundation approach only the PD is estimated by the Bank, for the other parameters reference is made to the indications from the supervisory authorities.

Junior

In a securitisation transaction it is the lowest-ranking tranche of the securities issued (Equity tranche), being the first to bear losses that may occur in the course of the recovery of the underlying assets.

LDA - Loss Distribution Approach

Method for quantitative assessment of the risk profile through the actuarial analysis of single events of internal and external loss; by extension, Loss Distribution Approach shall also include the historical capital calculation model by Business Unit

Liquidity risk

The risk that a company will be unable to meet its payment obligations due to its inability to liquidate assets or obtain adequate funding from the market (funding liquidity risk) or due to the difficulty/impossibility of rapidly converting financial assets into cash without negatively and significantly

affecting their price due to inadequate market depth or temporary market disruptions (market liquidity risk).

Loss Given Default (LGD)

It indicates the estimated loss rate in the event of borrower default.

Macro-hedging

Use of macro-hedging. Hedging procedure involving a single derivative product for various positions.

Market risk

Risk deriving from the fluctuation in the value of quoted financial instruments (shares, bonds, derivatives, securities denominated in foreign currency) and of financial instruments whose value is linked to market variables (loans to customers as concerns the interest rate component, deposits in euro and in foreign currency, etc.).

M-Maturity

The remaining time of an exposure, calculated according to the prudence principle. For banks authorised to use internal ratings, it is explicitly considered if the advanced approach is adopted, while it is fixed at 2.5 years if the foundation approach is used.

Mezzanine

In a securitisation transaction it is the tranche ranking between junior and senior tranche.

Non performing

Term generally referring to loans for which payments are overdue.

Operational risk

The risk of suffering losses due to inadequacy or failures of processes, human resources and internal systems, or as a result of external events. Operational risk includes legal risk, that is, the risk of losses deriving from breach of laws or regulations, contractual or tortious liability or other disputes, ICT (Information and Communication Technology) risk and model risk. Strategic and reputational risks are not included.

Past due loans

"Past due loans" are non-performing loans on which payments are past due on a continuing basis for over 90/180 days, in accordance with the definition set forth in current supervisory reporting rules.

Performing

Term generally referring to loans characterised by regular performance.

Pool (transactions)

See "Syndicated lending".

Private equity

Activity aimed at the acquisition of equity investments and their subsequent sale to specific counterparties, without public offerings.

Probability of Default (PD)

The likelihood that a debtor will default within the space of 1 year.

Prudential filters

In schemes for calculating regulatory capital, corrections made to line items with the aim of safeguarding the quality of regulatory capital and reducing its potential volatility as a result of the application of international accounting standards (IAS/IFRS).

Ratings

An evaluation of the quality of a company or of its bond issues, based on the company's financial strength and outlook. Such evaluation is performed by specialised agencies or by the Bank based on internal models.

Retail

Customer segment mainly including households, professionals, retailers and artisans.

Risk Management

Activity pertaining to the identification, measurement, evaluation and overall management of various types of risk and their hedging.

Risk Weighted Assets (RWA)

On- and off-balance sheet assets (derivatives and guarantees) that are classified and weighted by means of several risk ratios, in accordance with the rules issued by regulatory authorities on the calculation of capital ratios.

Scoring

System for the analysis of company customers, yielding an indicator obtained by examination of financial statements data and sector performance forecasts, analysed by means of statistical methods.

Securitisation

A transaction in which the risk associated with financial or real assets is transferred to a special-purpose vehicle by selling the underlying assets or using derivative contracts. In Italy the primary applicable statute is Law 130 of 30 April 1999.

Senior/Super senior tranche

In a securitisation transaction, this is the tranche that has first claim on interest and principal payments.

Sensitivity

It refers to the degree of sensitivity with which certain assets/liabilities react to changes in rates or other input variables.

Servicer

In securitisation transactions, it is the organisation that – on the basis of a specific servicing contract – continues to manage the securitised credits or assets after they have been transferred to the special purpose vehicle tasked with issuing the securities.

Syndicated lending

Loans arranged and guaranteed by a pool of banks and other financial institutions.

Slottina

A system for calculating capital requirements, based on regulatory classification criteria, applicable to the exposures relating to Specialised Lending by banks authorised to use the internal credit risk rating system (for more details, see Bank of Italy Circular 263/2006, Title II, Chapter 1, Part II, Section V).

SPE/SPV

Special Purpose Entities or Special Purpose Vehicles are companies established by one or more entities to perform a specific transaction. Generally, SPEs/SPVs have no operating and managerial structures of their own and rely on those of the other parties involved in the transaction.

Spread

This term can indicate the difference between two interest rates, the difference between the bid and ask price of a security or the price an issuer of stocks and bonds pays above a benchmark rate.

Stress tests

A simulation procedure designed to assess the impact of extreme market scenarios on a bank's overall exposure to risk.

Tier 1

Tier 1 equity includes Common Equity Tier 1 (CET1) and Additional Tier 1 (AT1).

Tier 1 ratio

The ratio of Tier 1 capital, which includes Common Equity Tier 1 (CET1) and Additional Tier 1 (AT1) to total risk-weighted assets.

Tier 2

Tier 2 capital is mainly composed of eligible subordinated liabilities and any excess of adjustments over and above expected losses (the excess reserve) for positions weighted according to IRB approaches.

Specific transitional provisions (grandfathering) have also been established for subordinated instruments that do not meet the requirements envisaged in the new Basel 3 regulatory provisions, aimed at the gradual exclusion of instruments no longer regarded as eligible from own funds (over a period of eight years).

Total capital ratio

Capital ratio referred to own funds components (Tier 1 plus Tier 2).

Trading book

The portion of a portfolio of securities or other financial instruments earmarked for trading activity.

VaR - Value at Risk

The maximum value likely to be lost on a portfolio as a result of market trends, estimating probability and assuming that a certain amount of time is required to liquidate positions.

The Intesa Sanpaolo skyscraper. Innovation and reinvention in the Bank and the city.

Designed to bring together the central offices and the main management departments of the Bank in a single location, the Intesa Sanpaolo skyscraper is a new meeting point in the city of Turin. Built in a strategic position, at the edge of the city centre in a high traffic area, the building is an original example of "relational architecture". Designed by Renzo Piano Building Workshop and constructed by the most qualified Italian companies at the global level, the skyscraper embodies the values of growth, architectural innovation, social and environmental sustainability and integration between workspaces and areas open to the public. The base and the top of the building have areas that can be accessed by the public, such as the Auditorium and the bioclimatic greenhouse with a restaurant, an exhibition room and a panoramic café. These spaces make the skyscraper a public attraction, contribute to integrating the building in the social fabric of the city, and consolidate the historic bond between the Bank and the territory, which has been innovating and reinventing itself since 1563.

166.26 m high

7,000 m² basement surface area

38 floors above ground (27 devoted to offices)

1,600 m² photovoltaic panels

15,000 m³ greenhouse

175 new trees to redevelop the "Grosa" public garden

364 seats in the multi-purpose Auditorium

49 children cared for in the company crèche

500 workers and technicians employed to construct the tower

30 specialist studios involved in the planning phases

35 young graduates involved at the worksite

ENVIRONMENTAL CERTIFICATION

Thanks also to the "double skin" facade, the use of geothermal energy and the LED lighting system, the skyscraper manages, controls and optimises its overall energy consumption. For this reason it was the first tall building in Europe to be awarded LEED (Leadership in Energy & Environmental Design) Platinum, the highest level of certification awarded by the Green Building Council, the most authoritative international body for the environmental assessment of buildings.
